Richmond Hill, ON L4B 1J8

Attention: Tyrone Gan, P.Eng., Senior Vice President
Director of Transportation, Canada

RE: Preliminary Hydrogeological Investigation
Proposed Regional Road Corridor Improvements
Winston Churchill Boulevard, Bush Street, Old Main Street, Mississauga Road, and Olde Base Line Road
Town of Caledon, Regional Municipality of Peel, Ontario

Dear Mr. Gan:

Coffey Geotechnics Inc. (Coffey) is pleased to provide HDR Corporation with a final report on our preliminary hydrogeological investigation for the above-noted project. The report presents Coffey's understanding of the geologic and hydrogeological setting of the study area based on investigative drilling, data collection, analysis, and review.

We trust that this information meets your present requirements. If we can be of additional assistance in this regard, please contact this office.

For and on behalf of Coffey,

W. Brad Benson, P.Eng.
Senior Hydrogeologist

List of Acronyms and Definitions

Coffey	Coffey Geotechnics Inc.
HDR	HDR Corporation
BH	Borehole
K	Hydraulic conductivity
masl	Metres Above Sea Level
mbgs	Metres Below Ground Surface
MOE	Ontario Ministry of the Environment
O.Reg.903	Ontario's Wells Regulation
PTTW	Permit to Take Water
EcoLog ERIS	Environmental Risk Information Service
WWR	Water Well Record

1 INTRODUCTION

Coffey Geotechnics Inc. (Coffey) was retained by HDR Corporation (HDR) on behalf of The Regional Municipality of Peel (Region of Peel) to conduct a preliminary hydrogeological investigation as part of a Schedule C Class Environmental Assessment Study in support of proposed improvements to a regional road corridor which is bounded by Winston Churchill Boulevard, Bush Street, Old Main Street, Mississauga Road and Olde Base Line Road in the Town of Caledon in the Region of Peel, Ontario (hereafter referred to as the Site). The location of the Site is shown on **Figure 1**.

The roads that make up the Site are currently two-lane urban roads with gravel shoulders. Based on information provided at the outset of the study, it was understood that the proposed road improvement works will focus on pavement structure upgrades, improved adequacy for heavy truck usage, road geometry and traffic safety, road drainage deficiencies, and pedestrian and bicycle traffic. The total length of the roads to be improved is approximately 17 km. The roads cross several small streams with existing pipe culverts.

The services that Coffey provided to HDR Corporation included a preliminary geotechnical investigation and pavement design, a culvert condition survey, a contamination overview study, and a preliminary hydrogeological investigation. The reports for the geotechnical investigation, the culvert condition survey, and the contamination overview study are provided under separate cover.

The primary objectives of the preliminary hydrogeological investigation were to characterize the baseline subsurface hydrogeologic conditions before the start of the proposed road improvement works at the Site, to identify water supply wells and other groundwater features that may be at risk of being affected by the road improvement works, to evaluate potential impacts to groundwater resources resulting from the road works, and to develop appropriate measures or plans to monitor and mitigate the potential impacts.

2 SCOPE OF WORK AND METHOD OF INVESTIGATION

2.1 General

The preliminary hydrogeological investigation began with a review of previously completed geotechnical reports and published information for the Site, including previously published regional physiographic and geologic mapping and watershed planning reports. Many of these documents are referred to throughout various sections of this report and the relevant details are provided in the References section following the text of the report.

In particular, the work completed under the preliminary hydrogeological investigation consisted of the following tasks:

- Reviewing and interpreting available reports and published data;
- Drilling twelve (12) boreholes and installing ten (10) 50-millimetre (mm) diameter groundwater monitoring wells;
- Developing the groundwater monitoring wells and performing in-situ hydraulic conductivity testing (slug tests) for the encountered aquifer formations;
- Measuring groundwater levels manually in the monitoring wells located at the Site;
- Reviewing information on the presence of water wells within 500 m of the roads at the Site as obtained from the Ministry of the Environment (MOE) water well information system;
- Reviewing environmental records obtained from an EcoLog ERIS database search to identify potential contaminant sources;
- Assessing potential impacts resulting from the proposed road improvement works on groundwater wells and other groundwater resources in the vicinity of the Site;
- Developing reasonable monitoring and mitigation measures for potentially impacted water supply wells or watercourses; and
- Preparing this report.

2.2 Borehole Drilling and Monitoring Well Installation

Twelve (12) boreholes were drilled at the Site in December 2012 and January 2013 in conjunction with the hydrogeological investigation. Groundwater monitoring wells were installed in ten (10) of the boreholes. The borehole and monitoring well locations were distributed at selected locations near culverts or stream crossings along the road alignments for Winston Churchill Boulevard (BH 25-WC, BH H1-WC, BH 10-WC and BH 8-WC), Olde Base Line Road (BH H3-OBL, BH H2-OBL and BH H1-OBL), Mississauga Road (BH H1-MR, BH H2-MR, BH H3-MR and BH H4-MR) and Bush Street (BH H1-BS). The borehole locations were selected based on the presence of flowing streams and the associated potential for shallow groundwater to be encountered. The locations of the boreholes and monitoring wells are shown on **Figure 2**.

The boreholes were advanced using a truck-mounted power auger drill rig supplied and operated by HL Drilling and Construction of Mississauga, Ontario. The boreholes were advanced using 108-mm inside diameter hollow stem augers and the drilling was monitored on a full-time basis by Coffey staff. Standard penetration testing and soil sampling were carried out in the boreholes at regular intervals of depth using 50-mm diameter split-spoon sampling equipment. The boreholes were advanced to depths ranging from 2.1 to 6.7 m below ground surface. All but one of the boreholes (BH 25-WC) were terminated due to auger refusal on what was generally inferred to be bedrock at depths ranging from 2.1 to 5.0 m. During the field work, Coffey staff carried out soil sampling and field testing, recorded the geologic conditions, classified the soil samples by tactile and visual methods and measured the groundwater levels. Copies of the borehole logs are provided in **Appendix A**. Grain size analyses were carried out for selected soil samples and the resulting grain size distribution curves are included in **Appendix A**.

For the purpose of assessing groundwater conditions at the Site, monitoring wells were installed in all of the boreholes except BH 8-WC and BH H1-BS. The monitoring wells were constructed with 50-mm diameter PVC well screen and pipe, which were pre-packaged by the supplier and transported to the Site by the drilling contractor. The monitoring wells were constructed with machine-slotted well screens ranging in length from 0.9 to 3.0 m, depending on the depth of the borehole and the encountered water table. The borehole annulus was backfilled with commercial filter sand to approximately 0.3 to 0.9 m above the well screen. The remainder of the annulus was backfilled with granular bentonite. The monitoring wells were covered with flush-mounted steel protective covers.

Ground surface and top of pipe elevations at the borehole locations were surveyed by Coffey using GPS surveying equipment. The elevations were referenced to geodetic datum.

Information on the monitoring well depth and screened intervals is summarized in **Table 1**, below.

Table 1: Information on Groundwater Monitoring Wells

Well ID	Well Location	Ground Surface Elevation (m)	Borehole Bottom		Well Screen Interval Depth (mbgs)		Well Screen Interval Elevation (m)	
			Depth (mbgs)	Elevation (m)	from	to	from	to
BH H1-WC	Winston Churchill Boulevard	401.6	5.0	396.6	4.1	2.6	397.5	399.0
BH 10-WC		395.0	3.9	391.1	3.4	1.8	391.6	393.2
BH 25-WC		412.1	6.7	405.4	5.8	2.7	406.3	409.4
BH H1-OBL	Olde Base Line Road	372.1	3.9	368.2	3.8	2.3	368.3	369.8
BH H2-OBL		371.2	3.1	368.1	3.0	1.5	368.2	369.7
BH H3-OBL		370.0	3.5	366.5	3.0	1.5	367.0	368.5
BH H1-MR	Mississauga Road	390.1	3.7	386.4	3.0	1.5	387.1	388.6
BH H2-MR		395.3	2.3	393.0	1.8	0.9	393.5	394.4
BH H3-MR		400.5	2.4	398.1	2.0	1.1	398.5	399.4
BH H4-MR		405.2	4.9	400.3	4.3	2.7	400.9	402.5

Notes: Elevations in metres relative to geodetic datum
mbgs = metres below ground surface

2.3 Installation of Streambed Piezometers

As part of the hydrogeological investigation, four (4) streambed monitoring stations were established in January 2013 at locations near stream crossings (where surface water was present) within the road allowances for the Site in order to obtain information on the interaction between groundwater and surface water. At each monitoring station, a pointed mini-piezometer (19 mm diameter) was driven into the streambed and a staff gauge was established in the stream adjacent to the piezometer. Water levels were subsequently monitored in the piezometer and in the adjacent stream and the head difference between the groundwater elevation inside the piezometer and the surface water elevation outside of the piezometer was recorded. The locations of the piezometers/streambed monitoring stations on Mississauga Road (PZ-1) and Olde Base Line Road (PZ-2, PZ-3, PZ-4) are shown on Figure 2. The installation details for the four (4) piezometers are summarized in Table 2, below.

Table 2: Information on Streambed Piezometers

Piezometer ID	Total Length of Piezometer (m)	Length of Piezometer below Streambed (m)	Length of Piezometer above Streambed (m)	Depth from Streambed to Middle of Piezometer Screen (m)
PZ-1	1.96	0.96	1.0	0.74
PZ-2	1.96	1.13	0.83	0.91
PZ-3	1.96	0.98	0.98	0.76
PZ-4	1.96	0.96	1.0	0.74

2.4 Hydraulic Conductivity Testing and Groundwater Level Monitoring

Coffey developed the groundwater monitoring wells at the Site by purging and surging the well water to remove mobile particulates. The purpose of the well development was to improve the hydraulic connection between the well and the geologic materials in the vicinity of the well. After development, rising head hydraulic conductivity tests (slug tests) were conducted on the groundwater monitoring wells to facilitate an assessment of the hydraulic conductivity of the soil strata adjacent to the well screens. From one to four separate tests were carried out in each of the eight tested wells.

A summary of the hydraulic conductivity test (slug test) methodology is as follows:

- The static groundwater level in each monitoring well was initially measured and recorded;
- Water was removed from each tested well using a bailer or an inertial pump and low density tubing to achieve a known drawdown;
- The rising water level in each well was then measured and recorded at regular time intervals until the water level had recovered to approximately 90% of the static water level;
- The water level data from the monitoring wells were analysed using AQTESOLV Professional V4.5 and the Bouwer-Rice method to estimate the hydraulic conductivity (K) of the soil adjacent to the screened portion of the well.

The hydraulic conductivity test data and analysis for each well is provided in Appendix B. Groundwater levels were measured manually in the monitoring wells on several occasions in the period between January 4 and April 4, 2013.

3 SITE CONDITIONS

3.1 Site Description

The Site is rectangular in shape and consists of portions of Mississauga Road (Peel Road 1, approximately 5 km length) and Winston Churchill Boulevard (Peel Road 19, approximately 6 km length) on the northeast and southwest sides, respectively. On the southeast side, the Site consists of a 2.6 km length of Olde Base Line Road (Peel Road 12) and on the northwest side by a similar length of Bush Road (Peel Road 11). The Site is located in the Town of Caledon in the Region of Peel, and encompasses Lots 1 to 9 and part of Lot 10, Concessions 5 and 6 West of Hurontario Street in the Geographic Township of Caledon. Winston Churchill Boulevard forms the border between the Town of Caledon and the Town of Erin in the County of Wellington to the west. The community of Belfountain is located at the intersection of Mississauga Road and Bush Street. Mississauga Road becomes Old Main Street in the community of Belfountain, south of Bush Street. The community of Erin is located approximately 3 km west of the Site.

Existing land use in the vicinity of the Site is shown in the aerial photographic images on **Figures 1 and 2**. In general, land use within the Site is predominantly agricultural and rural residential, with some natural areas that are bush-covered.

According to the Oak Ridges Moraine Atlas which is available online (at http://www.mah.gov.on.ca/page334.aspx), the Site is not located within an area where the Oak Ridges Moraine Conservation Plan is applicable. According to Niagara Escarpment Plan (NEP) maps available online at (http://www.escarpment.org/landplanning), portions of the Site are located within the Niagara Escarpment Plan Area. Near the southeast corner of the Site, the lands adjacent to Mississauga Road and Olde Base Line Road are mapped as Escarpment Protection Area or Escarpment Rural Area. Near the northeast corner of the Site, the community of Belfountain was shown on the NEP map as a minor urban centre and lands adjacent to Mississauga Road and Bush Street were shown as Escarpment Rural Area, Escarpment Protection Area, or Escarpment Natural Area.

3.2 Climate

An Environment Canada meteorological station, identified as Georgetown WWTP (Station ID 6152695), is located approximately 13.5 km southeast of the Site. The average monthly precipitation and temperature data (30-year normals) for this station for the period between 1971 and 2000 are provided in **Table 3**, below. The data indicate that the mean annual precipitation is 885 mm, with annual mean rainfall of 743.8 mm (84% of the total average annual precipitation). Total precipitation varies moderately by season with the highest average monthly precipitation of 84.9 mm recorded in August and the lowest monthly precipitation of 58.6 mm recorded in February.

The mean annual daily temperature is 6.8 °C. The coldest month is January with a mean daily temperature of -6.6°C and the warmest month is July with a mean daily temperature of 19.7°C

Table 3: Climate Data Summary (1971 – 2000) for Georgetown WWTP Station

Month	Average Daily Temperature (°C)	Average Rainfall (mm)	Average Snowfall (cm)	Average Precipitation (mm)
January	-6.6	29.5	37.3	66.7
February	-5.5	27.2	31.4	58.6
March	-1	43.7	22.7	66.3
April	5.8	68.7	6.7	75.4
May	12.3	74.6	0.3	74.9
June	17	80.1	0	80.1
July	19.7	74.9	0	74.9
August	18.8	84.9	0	84.9
September	14.4	84.3	0	84.3
October	8.1	66.7	0.5	67.2
November	2.4	70.1	8.9	79.0
December	-3.4	39.1	33.8	72.7
Year	6.8	743.8	141.5	885

NOTE: Data were obtained from Environment Canada website.

3.3 Physiography and Drainage

The majority of the Site is located in the physiographic region identified as the Horseshoe Moraines, with a small portion of the Site along Bush Street located in the physiographic region identified as the Guelph Drumlin Field (Chapman and Putnam, 1984). The northeast corner of the Site skirts the physiographic region identified as the Niagara Escarpment. The Horseshoe Moraines are characterized by hummocky terrain containing mostly till soils with numerous depressions often being filled with water. The soils of the Horseshoe Moraines are predominantly composed of sandy silt till (Wentworth Till). The area of the Guelph Drumlin Field is characterized by a gently sloping topography in a southeasterly direction towards the West Credit and Main Credit Rivers, which are located to the north and east of the Site. The soils in the Guelph Drumlin Field are primarily composed of sandy silt till (Port Stanley Till) and the valley areas within the Guelph Drumlin Field contain glaciofluvial outwash sands and gravels that appear to extend to bedrock at many locations (CVCA, 1998). The physiographic region identified as the Niagara Escarpment occurs east and south of the Site. The Niagara Escarpment is a major topographic break in the bedrock, formed as a result of differential erosion of softer underlying Queenston Formation shale to the east and the harder carbonate Amabel Formation dolostone to the west (Chapman and Putnam, 1984).

The Site is located within the Credit River watershed under the jurisdiction of the Credit Valley Conservation Authority (CVCA). The Credit River is almost 90 km long and meanders southeast from its headwaters in Orangeville, Erin and Mono through nine municipalities, eventually draining into Lake Ontario at Port Credit, Mississauga. The West Credit River (also referred to as the Erin Branch) flows from west to east and skirts the northeast corner of the Site at Belfountain. The West Credit River merges with the main branch approximately 1 km northeast of the Site (Forks of the Credit).

West Credit River merges with the main branch approximately 1 km northeast of the Site (Forks of the Credit).

Topographic relief at the Site is largely the result of glacial and glaciofluvial features that dominate the local landscape. Based on topographic mapping, the ground surface at the Site ranges from a maximum elevation of approximately 433 m near the north-central part to a minimum elevation of approximately 370 m southeast of the intersection of Olde Base Line Road and Mississauga Road. Mapping indicated the presence of several watercourses in the area contained by the Site. With the exception of a small watercourse crossing Bush Street and flowing north to the West Credit River, the watercourses generally flowed in a southerly direction, crossing Mississauga Road, Olde Base Line Road, and Winston Churchill Boulevard in the south half of the Site.

The northeast corner of the Site near the downstream reach of the West Credit River is part of an Environmentally Significant Area (ESA), Credit Forks-Devil's Pulpit, as well as part of a provincially significant Life Science ANSI (Area of Natural or Scientific Interest), the Credit Forks ANSI (CVCA, 1998). An ESA is an area where ecosystem functions or features warrant special protection. A Life Science ANSI is a significant representative segment of Ontario's biodiversity and natural landscapes including specific types of forests, valleys and wetlands, their native plants and animals, and their supporting environments. The portion of the Site north of The Grange Side Road is classified as Belfountain Wetland Class 7 (CVCA, 1998). In Ontario, Class 4 to 7 wetlands, while not being provincially significant, often play important regional roles in terms of hydrology or biology (CVCA, 1998).

3.4 Surficial Geology

The Niagara Escarpment is the most significant geological feature near the Site. The escarpment was formed through differential erosion of the bedrock units by marine intrusion and fluvial erosion prior to glaciation. The glaciation that occurred during the Pleistocene Epoch not only further eroded and scoured through repeated ice advance and retreat, but also resulted in the overburden deposits in the area near the Site (CVCA, 2007). West of (above) the escarpment, including the area of the Site, the overburden thickness is highly variable ranging from 0 m at the escarpment where bedrock outcrops to 50 m near Orangeville, approximately 15.5 km northwest of the Site.

A regional description of the surficial geology in the vicinity of the Site is provided in the Surficial Geology of Southern Ontario (GIS based geological map), Scale 1:50,000 (Ontario Geological Survey, 2010). A section of this map showing the surficial geology at the Site and surrounding areas is shown on Figure 3.

The surficial geology at the Site is mapped as predominantly Wentworth Till, a poorly sorted sandy silt to silty sand-textured till. The northern portion of the Site along Bush Street as well as the area to the north of the Site is shown to be covered by glaciofluvial outwash deposits consisting of gravel and gravelly sand, frequently overlain by sand or silt. Paleozoic bedrock exposures are mapped at the southeast corner of the Site, extending to the north and south, and close to the northeast corner of the Site. East of the Site, and east of the Niagara Escarpment, the mapping showed the presence of predominantly Halton Till, a clay to silt-textured till (derived from glaciolacustrine deposits or shale). Some patches of ice-contact deposits consisting of sand and gravel with minor silt, clay and till were shown near the northeast and southwest corners of

the Site and in the area west of the Site. Modern alluvial deposits (consisting of clay, silt, sand, gravel, and organic remains) associated with the West Credit River and the main branch of the Credit River exist north and east of the Site.

The underlying bedrock at the Site and generally in the area above (west of) the Niagara Escarpment is mapped as Middle Silurian aged Amabel Formation dolostone. The formation is typically massive, unbedded, light grey to brown weathering, finely crystalline dolostone. The porosity is reportedly variable and may be intergranular or vuggy (Ontario Geological Survey Map 2339, Paleozoic Geology, Orangeville Area, 1976). East of the Site and below (east of) the Niagara Escarpment, the surficial bedrock is mapped as Queenston Formation shale.

4 SUBSURFACE SOIL CONDITIONS

Eleven of the twelve boreholes advanced for the hydrogeological investigation were terminated due to auger refusal on what was generally inferred to be bedrock at depths ranging from 2.1 to 5.0 m below ground surface. BH 25-WC near the northwest corner of the Site was advanced to a depth of 6.7 m and was terminated in sand and gravel with some silt.

All of the boreholes encountered surficial fill material, which extended to depths ranging from approximately 0.7 to 3.8 m. With the exception of BH H1-BS on Bush Street, all of the boreholes encountered sand and gravel fill at surface, extending to depths ranging from approximately 0.7 to 2.3 m. Beneath the sand and gravel fill, the encountered fill material was variable in nature and included silty sand, sandy silt, clayey silt, and silty clay. Borehole BH H1-BS on Bush Street encountered sandy silt fill at surface and was terminated in what was inferred to be sandy silt fill due to auger refusal at a depth of approximately 2.7 m. A layer of clayey silt was encountered within the fill at that location. Borehole BH H2-OBL was terminated in possible fill material (organic silt, some clay) due to auger refusal at a depth of approximately 3.1 m below ground surface.

On Winston Churchill Boulevard, on the west side of the Site, the boreholes encountered predominantly granular soil beneath the upper fill. In the north portion of the Site, BH 25-WC encountered a relatively thin stratum of clayey silt from approximately 3.8 to 4.6 m depth, underlain by sand and gravel with some silt. BH 25-WC was terminated in the sand and gravel at a depth of 6.7 m. In the south portion of the Site, BH H1-WC and BH 8-WC encountered silty sand beneath the upper fill and were terminated in the silty sand due to auger refusal at depths of 5.0 and 2.4 m, respectively. BH10-WC encountered sandy silt beneath the fill, between approximately 1.1 and 3.0 m depth. The sandy silt was underlain by silty sand and BH10-WC was terminated in that material at a depth of 3.9 m.

On Mississauga Road, on the east side of the Site, the boreholes also encountered predominantly granular soil beneath the upper fill. BH H4-MR encountered sandy silt beneath the fill and was terminated in the sandy silt due to auger refusal at a depth of 4.9 m. South of BH H4-MR, BH H3-MR encountered gravelly sand with some silt beneath the fill and was terminated in the gravelly sand at a depth of 2.3 m. Further to the south, BH H2-MR and BH H1-MR encountered silty sand beneath the fill and were terminated in the silty sand at depths of 2.1 and 3.5 m, respectively.

On Olde Base Line Road, on the south side of the Site, the native soils encountered in the boreholes were typically finer grained. BH H3-OBL encountered silty clay between approximately 1.5 and 3.0 m depth, underlain by sandy silt with some clay. The borehole was terminated in that material due to auger refusal at a depth of 3.5 m. Further to the east, BH H1-OBL encountered silt with some sand and some clay at approximately 2.3 m depth and was terminated in that material at a depth of 3.8 m. As previously noted, BH H2-OBL was terminated in organic silt with some clay that was inferred to be fill at a depth of 3.1 m.

5 GROUNDWATER CONDITIONS

5.1 Groundwater Level Measurements

5.1.1 Monitoring Wells

The groundwater level data for the monitoring wells are summarized in **Table 4,** below. The screen elevations of these monitoring wells are shown in **Table 2** and on the borehole logs provided in **Appendix A**. A number of groundwater level monitoring events were carried out in the period from January to April 2013, although not all of the monitoring wells were access for each event. Groundwater levels in the monitoring wells were measured at depths ranging from 0.5 m to 2.9 m below existing ground surface. The corresponding groundwater elevations ranged from a high of 411.2 m at BH 25-WC, located on Winston Churchill Boulevard near the northwest corner of the Site, to a low of 367.2 m measured at BH H3-OBL on Olde Base Line Road near the southwest corner of the Site. The recorded groundwater elevations generally followed the ground surface topographic elevations, which ranged from approximately 412 to 368 m across the Site. The shallow groundwater flow direction was indicated to be generally towards the south.

The highest groundwater levels at the monitoring locations were typically measured on April 4, 2013 and the lowest levels were measured on January 4, 2013. At individual monitoring locations, the measured groundwater levels in the period from January 14 to April 4, 2013 generally varied by approximately 0.1 to 0.6 m. On April 4, 2013, the measured groundwater levels ranged from approximately 0.3 to 1.5 m below ground surface at the monitoring locations.

5.1.2 Streambed Piezometers

The interaction between groundwater and surface water was monitored at the four streambed monitoring stations (shown on **Figure 2**) and the results are summarized in **Table 5**, below. The results show the groundwater elevation measured in the streambed piezometer and the surface water elevation in the adjacent watercourse for each monitoring event, together with the inferred vertical hydraulic gradient. The hydraulic gradient is a function of the head difference between the groundwater and surface water elevations and the depth from the streambed to the mid-point of the piezometer screen. A positive vertical hydraulic gradient (i.e., upward gradient) indicates that there is local groundwater discharge to surface water and a negative vertical hydraulic gradient (i.e., downward gradient) indicates that there is local recharge from surface water to groundwater.

Water level measurements in the streambed piezometers were carried out on January 14, January 21, February 13, and April 4, 2013. At PZ-1 on Winston Churchill Boulevard, the monitoring results indicated that there was a negative hydraulic gradient on January 14, indicating that surface water was recharging groundwater, and a relatively small positive gradient (ranging from 0.04 to 0.15) on the other monitoring occasions indicating that there was local groundwater discharge to surface water.

PZ-2, PZ-3, and PZ-4 were located in relatively close proximity on Olde Base Line Road, with PZ-2 and PZ-3 located on upstream and downstream ends of a culvert on the same watercourse. PZ-4 was located approximately 400 m west of PZ-2 and PZ-3. At PZ-2 on the upstream (north) end of the culvert, the monitoring indicated there was generally neither groundwater recharge nor discharge (i.e., gradient near zero). On the downstream (south) end of the culvert, the monitoring

at PZ-3 indicated a negative gradient on January 14 (groundwater recharge) and a slight positive gradient of 0.03 to 0.09 (groundwater discharge) at the time of the other monitoring events. At PZ-4, the monitoring indicated that there was a slight negative gradient (-0.04 to -0.07) during three of the four monitoring events, indicating groundwater recharge, and slight positive gradient (0.03) on January 21, indicating groundwater discharge.

In summary, the water level monitoring carried out in the streambed piezometers on Winston Churchill Boulevard and Olde Base Line Road indicated that conditions were variable, with both groundwater recharge and discharge conditions recorded at each piezometer location during different monitoring events. In general, slight discharge conditions predominated at PZ-1 and PZ-3 and slight recharge conditions predominated at PZ-4.

It should be noted that groundwater and surface water conditions vary depending on factors such as temperature, season, precipitation, construction activity and other situations, which may be different from those encountered at the time of the monitoring. The potential for groundwater level fluctuations at the Site should be considered when designing and developing the construction plans for the project.

Table 4: Summary of Groundwater Level Measurements

Well ID	Well Location	Ground Surface Elevation (ml)	Groundwater Level											
			04-Jan-2013		14-Jan-2013		15-Jan-2013		21-Jan-2013		13-Feb-2013		04-Apr-2013	
			Depth (mbgs)	Elevation (m)	Depth (mbgs)	Elevation (m)	Depth (mbgs)	Elevation (ml)	Depth (mbgs)	Elevation (m)	Depth (mbgs)	Elevation (m)	Depth (mbgs)	Elevation (m)

Notes: 1. PZ indicates piezometer in stream and associated measurements are for depth to groundwater level below top of piezometer.
2. SG indicates staff gauge and associated measurements are for depth of surface water in stream above streambed.
3. Elevations in metres relative to geodetic datum.
4. A positive vertical gradient indicates local groundwater discharge to surface water. A negative vertical gradient indicates local surface water recharge to groundwater.

5.2 Hydraulic Conductivity Testing

The results of the hydraulic conductivity testing in the monitoring wells are summarized in **Table 6**, below. Included in **Table 6** is a description of the soils (stratigraphic unit) encountered in the associated borehole adjacent to the screened portion of the monitoring well and the sand pack, below the groundwater table. Also included in **Table 6** is an estimate of the hydraulic conductivity for the soil adjacent to the well screen that was based on the grain size distribution curves shown in **Appendix A** and the empirical method derived by Hazen for estimating hydraulic conductivity based on the effective grain size (D_{10}).

Table 6: Summary of In-situ Hydraulic Conductivity (K) Test Results

Monitoring Well ID	Slug Test Results				Estimated from Grain Size Distribution	Stratigraphic Unit
	Estimated K Trial 1 (cm/sec)	Estimated K Trial 2 (cm/sec)	Estimated K Trial 3 (cm/sec)	Estimated K Trial 4 (cm/sec)	Estimated K (cm/sec)	
BH H1-WC	1.0×10^{-5}	-	-	-	-	Silty Sand/Sandy Silt Fill Silty Sand
BH H10-WC	-	-	-	-	4.9×10^{-5}	Sandy Silt/Silty Sand
BH 25-WC	9.1×10^{-5}	-	-	-	8.1×10^{-5}	Silty Sand Fill Clayey Silt Sand/Gravel, some silt
BH H1-MR	1.4×10^{-4}	-	-	-	4.4×10^{-6}	Silty Sand, some clay
BH H2-MR	2.9×10^{-4}	3.7×10^{-4}	3.2×10^{-4}	3.0×10^{-4}	-	Silty Clay Fill Silty Sand
BH H3-MR	3.3×10^{-4}	3.5×10^{-4}	-	-	5.5×10^{-5}	Silty Sand Fill Gravelly Sand, some silt
BH H4-MR	9.9×10^{-5}	1.1×10^{-4}	-	-	7.3×10^{-6}	Sandy Silt
BH H1-OBL	2.7×10^{-4}	2.8×10^{-4}	-	-	2.6×10^{-6}	Silt, some sand
BH H3-OBL	2.8×10^{-4}	-	-	-	-	Silty Clay, some sand Sandy Silt, some clay

In general, there was relatively little variation in the hydraulic conductivity values estimated from the slug tests between monitoring locations. The estimated hydraulic conductivity values from the slug tests ranged from a high of approximately 4 x 10^{-4} centimetres per second (cm/sec) at BH H2-MR and BH H3-MR on Mississauga Road to a low of approximately 1 x 10^{-5} cm/sec at BH H1-WC on Winston Churchill Boulevard. The monitoring well in BH H1-WC was screened within variable fill material described as silty sand with some gravel and sandy silt, underlain by native silty sand. The estimated hydraulic conductivity from the slug test for that location was slightly lower than would have been anticipated for soils of that nature. Elsewhere, the estimated hydraulic values varied over a relatively narrow range of 9 x 10^{-5} to 4 x 10^{-4} cm/sec and were considered to be generally consistent with the soil types.

For BH 25-WC, the hydraulic conductivity estimated from the grain size distribution curve for a borehole soil sample was relatively close to the hydraulic conductivity value estimated from the slug test. Elsewhere, the hydraulic conductivity values estimated from the grain size distribution curves were approximately 1 to 2 orders of magnitude lower than the values estimated from the slug tests. In general, the hydraulic conductivity values from the slug tests appeared to be more consistent with the soil types than the values estimated from the grain size distribution curves.

5.3 Hydrostratigraphy

In general, it was considered that the sands and silts encountered below the upper fill and below the water table at the borehole locations would constitute a shallow unconfined aquifer for the purpose of assessment. At some borehole locations, the overlying fill was also saturated and would constitute part of the surficial aquifer. The results of the slug tests indicated that the surficial aquifer at the borehole locations was slightly permeable, with a typical hydraulic conductivity on the order of 9 x 10^{-5} to 1 x 10^{-4} cm/sec.

The upper bedrock underlying the overburden would potentially constitute a separate aquifer. In approximately the southern half of the Site, what was inferred to be bedrock was encountered in the boreholes at depths ranging from 2.1 to 5.0 m below ground surface. Fracturing is present in the bedrock units and is most pervasive in the upper few metres of bedrock and areas close to the escarpment face (CVCA, 2012). The characteristics of the bedrock aquifer were not investigated, which was consistent with the relatively shallow nature of the proposed works at the Site.

5.4 Regional Groundwater Recharge

Recharge is the process by which groundwater is replenished and involves the vertical infiltration of water through the subsoil deposits and geologic materials to the saturated zone. The amount of groundwater recharge in a particular area depends on surficial geology, topography, and the land development nature and extent in the area.

The Site is located within a rural area that is largely undeveloped and contains area of natural vegetation. The major sources of recharge in the area near the Site are precipitation and freshet. The lower reach of the West Credit River is located approximately 300 m north of Bush Street. The north potion of the Site along Bush Street is part of the valley area of the West Credit River. According to the West Credit Subwatershed Study Characterization Report (CVCA, 1998), the valley areas within the Guelph Drumlin Field contain glacio-fluvial outwash sands and gravels that appear to extend to bedrock at many locations. The valley areas are therefore generally considered as recharge areas that provide base flow to the West Credit River and its tributaries.

Most of the remaining portion of the Site is located within the Horseshoe Moraine physiographic region, which is characterized by hummocky terrain containing mostly till soils with numerous depressions that may seasonally contain standing water. The area typically has a moderately low infiltration rate because of the relatively low permeability near surface soils, but the hummocky nature of the ground surface may result in greater recharge as water is trapped in depressions and infiltrates into the groundwater table (CVCA, 1998). Calibrated mapping of groundwater recharge contained within the Assessment Report: Credit Valley Source Protection Area (CVCA, 2012) indicated that the northwestern portion of the Site, generally corresponding with the area mapped within the Guelph Drumlin Field, had a relatively high recharge rate on the order of 400 mm/year. The remainder of the Site was generally shown to have a moderate to high groundwater recharge rate.

5.5 Groundwater Use in the Study Area

Review of mapping of municipal residential drinking water systems on the MOE website indicated that some communities in the vicinity of the Site are currently serviced by municipal residential drinking water systems. These included the community of Inglewood to the northeast of the Site, the community of Cheltenham to the east of the Site, and the community of Terra Cotta to the southeast of the Site, which are currently serviced by the Peel Region Municipal Groundwater Drinking System, and the community of Erin to the west of the Site which is currently serviced by the Town of Erin Municipal Groundwater Drinking System. The community of Belfountain, located at the northeast corner of the Site at the intersection of Bush Street and Old Main Street (Mississauga Road), is not supplied by a municipal residential drinking water system. Mapping contained in the Assessment Report: Credit Valley Source Protection Area (CVCA, 2012) indicated that estimated groundwater capture zones associated with surrounding municipal water supply systems did not extend to within 500 m of the Site, although a portion of the West Credit River north of the Site was shown as a vulnerable surface water zone. The results of the water well survey summarized below indicated that there are a considerable number of private water supply wells within 500 m of the road alignments within the Site.

As part of the hydrogeological investigation, Coffey requested a search of the MOE water well information system (WWIS) database to identify potentially active water supply wells near the Site. A request was submitted to the MOE for a summary of provincial water well records from the WWIS database for the area located within 500 m on both sides of the road alignments within the Site. A tabularized summary of the water well record information provided by the MOE is included in **Appendix C**.

The WWIS database search identified 261 well records for wells that were shown to be located within approximately 500 m of the Site. The locations of those wells, based on the coordinates recorded in the WWIS database, are shown on **Figure 4A**. The wells were categorized based on the information regarding final status and well use recorded on the water well records. That information is shown on **Figure 4A** and is summarized below.

Reported Well Use	Number of Associated Well Records
Domestic	209
Domestic/Livestock	15
Livestock	2
Public	4
Irrigation	2
Test Hole/Monitoring Wells	6
Not Used	6
Abandoned	12
Not Stated	5

Of the 261 well records identified, 232 of the associated wells were shown to have been installed for water supply, with recorded uses as indicated above. The majority of the wells (224) were reportedly installed for domestic or domestic/livestock use. Four wells were reportedly installed for public use and the remaining four water supply wells were reportedly installed for irrigation or livestock use.

For the five (5) well records (Well IDs 4906949, 4908526, 4908527, 7121555 and 7190296) with no recorded information on final status or groundwater use, copies of the associated water well record sheets were obtained from the MOE and are included in **Appendix C**. Review of the well record sheets indicated that three (3) wells (Well IDs 4906949, 4908526 and 4908527) were relatively deep (deeper than 30 m) bedrock wells with no information on final status and water use. Two of the wells (Well IDs 7121555 and 7190296) were shown to have been abandoned.

Twenty-one (21) of the wells that were drilled for water supply were reportedly completed in the overburden and the remainder were completed in the bedrock. Where it was recorded on the water well records, the groundwater quality was generally reported as being fresh. On four records, three for wells completed in the bedrock and one for a well completed in the overburden, the water quality was reported as being "mineral", "sulphur", or "salty".

Coffey understands that the proposed road improvement works at the Site will focus on pavement structure upgrades, improved adequacy for heavy truck usage, road geometry and traffic safety, road drainage deficiencies, and pedestrian and bicycle traffic. The proposed road improvement work may involve shallow excavation (to an estimated maximum depth of 3 m) for culvert replacements or extensions, which would have the potential to impact local shallow groundwater supply wells, if present. For all but five (5) of the 232 wells that were reportedly installed for water supply, the reported depth was greater than 10 m. Based on the depth of the proposed works, it was considered that wells that were greater than 10 m in depth were unlikely to be impacted by interference effects from dewatering activities associated with the proposed works.

Five shallow wells were identified with a reported depth of less than 10 m (Well IDs 4901025, 4904879, 4900994, 4904489 and 6700805). Coffey requested copies of the water well record sheets for the five shallow wells and those are included in **Appendix C**. In general, shallow groundwater supply wells would be considered to be potentially susceptible to interference effects from dewatering activities associated with the proposed works. The recorded locations of both shallow and deep water supply wells within 500 m of the road alignments of the Site are shown on **Figure 4B.** For the five identified shallow wells, the records indicated that two were drilled wells

(Well IDs 4900994 and 4904489) completed in the limestone bedrock at a depth of 9.1 m. It is considered unlikely that those wells would be significantly impacted by groundwater interference effects from the proposed works. The records indicated that the other three wells were bored wells completed in the overburden at depths ranging from 4.9 to 7.6 m. The overburden at the well locations was variously described as red clay and gravel, shale clay and shale, and gravel with sand. There is a potential that other shallow water supply wells are present at the Site for which there are no corresponding provincial water well records.

5.6 Potential Contaminant Sources

Coffey assembled information regarding potential contaminant sources within a 250 m search radius around the Site by requesting an environmental database review report from Environmental Risk Information Services Ltd. (EcoLog ERIS report). A copy of the report is provided in **Appendix D**. The EcoLog ERIS report included search results of various federal, provincial and private environmental database sources. Two mappable records were identified for the Site, which were shown on the site diagram in Section ii of the EcoLog ERIS report in **Appendix D**. One record (SPL-1) was identified from the Ontario Spills database and was related to the release of approximately 18 litres of oil from a transformer in 2000 at a location at 5262 Winston Churchill Boulevard. The second record (CA-1) was related to an application for a Certificate of Approval for the installation of a small emergency diesel-powered generator at a site at 15801 Mississauga Road.

The EcoLog ERIS report also indicated potential soil or groundwater contaminant sources that were identified in the database search put could not be plotted on the map because of insufficient address information. These included the following:

- 2 locations within a 250 m radius of the Site were recorded as gas stations;
- 2 locations within a 250 m radius of the Site were registered in the Ontario Regulation 347 Waste Generators database;
- 6 spills were recorded within a 250 m radius of the Site.

Additional information on potential contaminant sources in the vicinity of the Site is provided in the separate contamination overview study prepared by Coffey.

Regional scale groundwater vulnerability mapping contained in the the Assessment Report: Credit Valley Source Protection Area (CVCA, 2012) indicated that approximately the southeastern third of the Site was a high groundwater vulnerability area, presumably because of the relatively thin overburden indicated by geological mapping for that area. The northwestern margin of the Site was also mapped as a high groundwater vulnerability area, presumably because of high permeability soils indicated by mapping for that area.

6 EVALUATION OF POTENTIAL IMPACTS

Coffey understands that the proposed regional road corridor Improvements will address the current road pavement structure deficiencies, road safety issues and stormwater management and drainage deficiencies to accommodate current and future road traffic operations. As a result, the following aspects will be included in the road improvements:

- Pavement design, rehabilitation and upgrade strategy;
- Road embankment construction, pavement subgrade preparation; and
- Culvert re-construction and/or extension, where necessary;

From a hydrogeological perspective, the construction of pavement upgrades is considered unlikely to impact groundwater levels and construction dewatering is not anticipated. A culvert condition survey is being conducted and reported separately. The survey results will provide additional information for road improvement design, including culvert replacement or extension. It is anticipated that the construction of replacement culverts and/or culvert extensions may involve excavation extending to or below the water table. As a result, there is a potential that localized construction dewatering will be necessary. Accordingly, construction dewatering rates and the associated zone of groundwater influence should be estimated. Generally, dewatering requirements may be variable depending on the size of the excavation (length, width and depth), aquifer properties and construction methods. Site specific dewatering estimates can be made based on the aquifer properties (hydraulic conductivity values, groundwater levels) as indicated in Section 5.1 and 5.2 of this report and when the design information is available.

In addition to localized groundwater dewatering, culvert reconstruction would potentially require diversion of surface water in the affected watercourse, which was not addressed in this report. Monitoring of streambed piezometers at selected locations as described in Section 5.1 indicated that conditions were variable, with both groundwater recharge and discharge conditions recorded at each monitoring location during different monitoring events. Based on the relatively localized nature and anticipated short term duration of potential culvert reconstruction, related impacts to the associated watercourses from a temporary interruption of groundwater discharge are not anticipated; however, those conditions should be assessed further when the design for the upgrades has been completed.

As indicated in Section 5.5, a search of the MOE water well records identified records for 232 water supply wells in the area located within 500 m of the road alignments within the Site. The majority of the wells (224) were reportedly installed for domestic or domestic/livestock use. The records indicated that all but five (5) of the water supply wells were installed at depths of 10 m or greater, predominantly in the bedrock. Shallow water wells may be present for which there is no associated water well record. Coffey considers that shallow water supply wells with a depth of less than 10 m are vulnerable to interference effects from construction dewatering, depending on the location of the well relative to the estimated zone of influence. Based on the shallow nature of the proposed works and the moderate permeability of the soils encountered in the boreholes at the Site, it is anticipated that the associated zone of groundwater influence for locations of excavation below the encountered water table will be relatively small.

Specific potential contaminant sources identified from the review of environmental databases in Section 5.6 were limited, and were considered unlikely to impact groundwater quality in association with groundwater dewatering for culvert upgrades, if necessary. Once the locations of culvert

upgrades have been confirmed and the potential for associated construction dewatering has been assessed, reference should be made to information contained in the separate contamination overview study to further assess the potential for impacts to groundwater quality from potential contaminant sources to be present in the vicinity of any excavations extending to the water table.

7 MONITORING AND MITIGATION PLAN

7.1 General

The potential dewatering rate and associated zone of influence should be estimated prior to construction for those construction activities where excavation extending below the water table is anticipated. The dewatering requirements may be variable depending on the size of the excavation (length, width and depth), aquifer properties and construction methods. A Permit to Take Water in support of the construction dewatering should be obtained from the MOE if the estimated dewatering rate is above 50,000 L/day, to ensure compliance with Ontario Regulation 387/04 and the Ontario Water Resources Act (OWRA). A well-described monitoring, mitigation, and contingency plan should be developed in conjunction with the PTTW application.

Where construction dewatering is anticipated, a monitoring program for groundwater levels and water quality should be undertaken to confirm that the dewatering impacts are within the predicted range. The following are general measures that should be undertaken for the monitoring and mitigation plans:

1. Planning and administration of the monitoring plan should be performed under the supervision of a qualified person.

2. A door-to-door survey of properties located within 150 m of the proposed dewatering locations should be carried out to document the presence and use of water supply wells. If shallow wells (less than 10 m depth) are identified, then the wells should be monitored for water level and water quality prior to, during, and after completion of the construction works, subject to the owner's permission.

3. Sufficient monitoring wells should be provided to document the effect of the dewatering on the local groundwater level. Depending on the location of the dewatering activities, the monitoring wells installed in conjunction with this investigation may or may not be suitable. It is anticipated that one or more of the monitoring wells installed for this investigation would be suitable for monitoring variations in the groundwater level that are unrelated to the proposed works (i.e., background conditions). Groundwater level monitoring should be carried out prior to, during, and after completion of the construction works. In addition, for culvert reconstruction the water level and flow rate in the affected watercourse should be routinely monitored.

4. Monitoring of groundwater quality and quantity should be documented and frequently assessed.

5. Water removed from the excavations should be treated as necessary prior to disposal so as not to result in environmental impacts to the receiving watercourse. Treatment could include the use of filtration, settlement tanks, or other approved devices. Approval for discharge should be obtained from the appropriate regulatory agencies.

6. Records of daily water quantity pumped, treatment method used, water quality parameters tested, and the method of discharge should be maintained and updated regularly by the construction contractor.

7. In conformance with O. Reg. 903 under the Ontario Water Resources Act, the installation and eventual decommissioning of the wells and pumping system should be carried out by a licensed contractor and under the supervision of a licensed water well technician.

7.2 Water Level Monitoring and Mitigation Plan

The following groundwater monitoring and mitigation plans are proposed. The monitoring plan can be adjusted based on the construction method(s).

7.2.1 Pre-construction

It is recommended that, at a minimum, a door-to-door survey be carried out for properties located within 150 m of the proposed dewatering location to document the presence and use of water supply wells and to determine if shallow water wells are in use for water supply. If a shallow water well (less than 10 m depth) is identified, then the potential for related interference effects should be assessed and a suitable program of groundwater level monitoring should be incorporated into the construction dewatering plan to document the effects of the dewatering activities on the well(s). In addition, it is recommended that, with the property owner's permission, a sample of water be obtained from any identified shallow water wells to document the groundwater quality. At a minimum, the water quality monitoring should include microbiological parameters (E. coli, total coliform), nitrate, chloride, sodium, hardness, and electrical conductivity.

It is recommended that baseline conditions be assessed by monitoring water levels in existing monitoring wells at quarterly intervals for up to one year prior to the commencement of construction activities. In addition, water level measurements for groundwater monitoring should be undertaken on a weekly basis for a minimum of two weeks prior to the start of construction.

7.2.2 During Construction

To observe the effects of the construction activities on the aquifer(s), regular water level monitoring should be conducted on available monitoring wells and in any accessible shallow wells identified within 150 m of the proposed dewatering activities, subject to the property owner's permission and provided that the well can be accessed safely. Water level monitoring in monitoring wells and in the affected watercourse should be carried out at a minimum of weekly intervals during construction dewatering. Water level and water quality monitoring in private wells should be carried out at a minimum of monthly intervals during construction dewatering. If the potential for interference with private water supplies is indicated, then the frequency of water level monitoring should be increased.

7.2.3 Post-construction

To identify the effect of the construction activities on the aquifer(s) within the vicinity of the Site after completion of the construction work, groundwater level monitoring should continue at weekly intervals in available monitoring wells and monthly intervals in nearby shallow wells for a period of at least one month after construction is completed. If an impact attributable to the dewatering is detected during the post-construction period, then monitoring should continue until there is no longer an effect on the water levels in the vicinity of the Site.

7.3 Dewatering Discharge Monitoring and Mitigation Plan

As there is unlikely to be a municipal sewer system in the vicinity of the proposed dewatering activities, it is anticipated that the dewatering discharge would have to be conveyed to a nearby watercourse. Prior to construction, the quality of the shallow groundwater and the nearby watercourse in areas of anticipated construction dewatering should be assessed for compatibility and to identify baseline conditions. At a minimum, water samples should be analysed for the inorganic parameters identified in the provincial water quality objectives (PWQO). Discharge to a watercourse should be carried out in consultation with, and based on approval from, appropriate regulatory agencies, including the MOE and CVCA. Depending on the sensitivity of the affected watercourse, additional biological assessment may be necessary.

7.3.1 Pre-construction

Suitable dewatering method(s) and volume of discharge need to be identified by the contractor using technical evaluation reports and proposed dewatering plan(s). Prior to construction, and where required, appropriate approvals should be in place for discharging water into a local watercourse, assuming that a municipal sewer system is not available. The location(s) of the point of discharge with respect to the dewatering systems need to be confirmed by the contractor and appropriate erosion and sedimentation control (ESC) measures such as filter bags, straw bales, and silt fences should be implemented.

7.3.2 During Construction

Discharge locations should be monitored on a daily basis. Discharge volume should be measured manually or by using a digital totalizing flow meter (on-line flow meter). In case of pumping at higher than expected dewatering rates, the pump capacity should be controlled and set at the rate specified in the PTTW obtained from MOE.

To document discharge quality, a sample should be collected upon commencement of discharge for analysis of the inorganic parameters identified in the PWQOs. During discharge, field parameters including temperature, pH, conductivity, and turbidity should be monitored at least once each working day for the first week and weekly thereafter. Sufficient chemical analysis of representative samples should be carried out so that field turbidity measurements can be used to estimate the corresponding suspended solids concentration.

If any impacts attributable to the dewatering are noted, then appropriate mitigation measures should be initiated. In the event of excessive sediment, these measures could potentially include use of additional straw bales, splash pads, and/or rock check dams to be installed downstream of the point of discharge.

7.3.3 Post-construction

Removal of the ESC features should be conducted at all discharge locations at the end of the dewatering activities. Approximately one week after the dewatering ends or mitigation measures have ended, the discharge point should be re-inspected to confirm that there are no disturbances.

8 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of the subsurface investigation and hydrogeological assessment, the following summary of conclusions and recommendations is provided:

- Eleven of the twelve boreholes advanced for the hydrogeological investigation were terminated due to auger refusal on what was inferred to be bedrock at depths ranging from 2.1 to 5.0 m below ground surface. BH 25-WC near the northwest corner of the Site was advanced to a depth of 6.7 m and was terminated in sand and gravel with some silt. On Winston Churchill Boulevard and Mississauga Road, the boreholes encountered primarily granular soils beneath the upper fill. On Olde Base Line Road, the native soils encountered below the upper fill were typically finer grained.

- Groundwater levels were measured in the monitoring wells at depths ranging from 0.5 to 2.9 m below existing ground surface. The recorded groundwater elevations generally followed the ground surface topographic elevations, and ranged from approximately 411 to 369 m across the Site. The shallow groundwater flow direction was indicated to be generally towards the south.

- Water level monitoring carried out in the streambed piezometers on Winston Churchill Boulevard and Olde Base Line Road indicated that conditions were variable, with both groundwater recharge and discharge conditions recorded at each piezometer location during different monitoring events.

- In general, it was considered that the sands and silts encountered below the upper fill and below the water table at the borehole locations would constitute a shallow unconfined aquifer for the purpose of assessment. At some borehole locations, the overlying fill was also saturated and would constitute part of the surficial aquifer. The results of the slug tests indicated that the surficial aquifer at the borehole locations was slightly permeable, with a typical hydraulic conductivity on the order of 9×10^{-5} to 1×10^{-4} cm/sec. The upper bedrock underlying the overburden would potentially constitute a separate aquifer.

- A search of the MOE water well information system identified 261 well records for the area located within approximately 500 m of the road alignments within the Site. Of those records, 232 of the associated wells were shown to have been installed for water supply, most (224) for domestic or domestic/livestock use. All but five (5) of those wells were reportedly drilled to depths greater than 10 m, with most completed in the bedrock.

- From a hydrogeological perspective, the construction of pavement upgrades is considered unlikely to impact groundwater levels and construction dewatering is not anticipated. It is anticipated that the construction of replacement culverts and/or culvert extensions may involve excavation extending below the water table. As a result, there is a potential that localized construction dewatering will be necessary. Construction dewatering rates and the associated zone of groundwater influence should be estimated after the extent of the culvert works has been determined. Based on the relatively localized nature and anticipated short term duration of potential culvert reconstruction, related impacts to the associated watercourses from a temporary interruption of groundwater discharge are not anticipated; however, those conditions should be assessed further when the design for the upgrades has been completed.

- Coffey considers that shallow water supply wells with a depth less than 10 m are vulnerable to interference effects from construction dewatering, depending on the location of the well relative to the estimated zone of influence. The review of water well records indicated that five (5) wells were completed to depths less than 10 m, although shallow wells may be present for which there is no associated well record. Based on the shallow nature of the proposed works and the moderate permeability of the soils encountered in the boreholes at the Site, it is anticipated that the associated zone of groundwater influence for locations of excavation below the encountered water table will be relatively small.

- The potential dewatering rate and zone of influence should be estimated on a site specific basis prior to construction for those construction activities where excavation below the water table is anticipated. A Permit to Take Water in support of the construction dewatering should be obtained from the MOE if the estimated dewatering rate is above 50,000 L/day, to ensure compliance with Ontario Regulation 387/04 and the Ontario Water Resources Act (OWRA).

- As there is unlikely to be a municipal storm sewer system in the vicinity of dewatering activities for culvert replacement, it is anticipated that discharge from dewatering would have to be conveyed to a nearby watercourse. Discharge to a watercourse should be carried out in consultation with, and based on approval from, appropriate regulatory agencies. A program of water quality monitoring should be carried out in conjunction with the discharge.

- In addition to the potential requirement for groundwater dewatering in association with proposed culvert upgrades, there is a potential that diversion of surface water in the affected watercourse would also be necessary. Diversion of surface water would potentially be subject to the requirement for a PTTW.

- Coffey recommends that a monitoring program be implemented before, during, and after any construction dewatering in association with the proposed culvert upgrades. A door-to-door survey should be carried out for properties located within 150 m of proposed dewatering activities to document the presence and use of water supply wells. If shallow water supply wells are identified, then they should be included in the monitoring program, subject to the owner's permission.

- Coffey recommends the decommissioning of existing groundwater monitoring wells from this investigation after completion of the construction of the project. If the monitoring wells would be damaged or destroyed by the proposed works, then they should be properly decommissioned in advance of the proposed construction. In conformance with Ontario's Wells Regulation (O.Reg. 903) of the Ontario Water Resources Act, the decommissioning of groundwater wells must be carried out by a licensed well contractor.

9 STATEMENT OF LIMITATIONS

The contents of this hydrogeological report are subject to the attached 'Important information about your Coffey Report' sheet. The reader's attention is specifically drawn to these conditions as it is considered essential that they be followed for proper use and interpretation of this report.

For and on behalf of Coffey,

SPECIALISTS MANAGING THE EARTH

Important information about your **Coffey** Report

As a client of Coffey you should know that site subsurface conditions cause more construction problems than any other factor. These notes have been prepared by Coffey to help you interpret and understand the limitations of your report.

Your report is based on project specific criteria

Your report has been developed on the basis of your unique project specific requirements as understood by Coffey and applies only to the site investigated. Project criteria typically include the general nature of the project; its size and configuration; the location of any structures on the site; other site improvements; the presence of underground utilities; and the additional risk imposed by scope-of-service limitations imposed by the client. Your report should not be used if there are any changes to the project without first asking Coffey to assess how factors that changed subsequent to the date of the report affect the report's recommendations. Coffey cannot accept responsibility for problems that may occur due to changed factors if they are not consulted.

Subsurface conditions can change

Subsurface conditions are created by natural processes and the activity of man. For example, water levels can vary with time, fill may be placed on a site and pollutants may migrate with time. Because a report is based on conditions which existed at the time of subsurface exploration, decisions should not be based on a report whose adequacy may have been affected by time. Consult Coffey to be advised how time may have impacted on the project.

Interpretation of factual data

Site assessment identifies actual subsurface conditions only at those points where samples are taken and when they are taken. Data derived from literature and external data source review, sampling and subsequent laboratory testing are interpreted by geologists, engineers or scientists to provide an opinion about overall site conditions, their likely impact on the proposed development and recommended actions. Actual conditions may differ from those inferred to exist, because no professional, no matter how qualified, can reveal what is hidden by earth, rock and time. The actual interface between materials may be far more gradual or abrupt than assumed based on the facts obtained. Nothing can be done to change the actual site conditions which exist, but steps can be taken to reduce the impact of unexpected conditions. For this reason, owners should retain the services of Coffey through the development stage, to identify variances, conduct additional tests if required, and recommend solutions to problems encountered on site.

Your report will only give preliminary recommendations

Your report is based on the assumption that the site conditions as revealed through selective point sampling are indicative of actual conditions throughout an area. This assumption cannot be substantiated until project implementation has commenced and therefore your report recommendations can only be regarded as preliminary. Only Coffey, who prepared the report, is fully familiar with the background information needed to assess whether or not the report's recommendations are valid and whether or not changes should be considered as the project develops. If another party undertakes the implementation of the recommendations of this report there is a risk that the report will be misinterpreted and Coffey cannot be held responsible for such misinterpretation.

Your report is prepared for specific purposes and persons

To avoid misuse of the information contained in your report it is recommended that you confer with Coffey before passing your report on to another party who may not be familiar with the background and the purpose of the report. Your report should not be applied to any project other than that originally specified at the time the report was issued.

SPECIALISTS MANAGING THE EARTH

Important information about your **Coffey** Report

Interpretation by other design professionals

Costly problems can occur when other design professionals develop their plans based on misinterpretations of a report. To help avoid misinterpretations, retain Coffey to work with other project design professionals who are affected by the report. Have Coffey explain the report implications to design professionals affected by them and then review plans and specifications produced to see how they incorporate the report findings.

Data should not be separated from the report*

The report as a whole presents the findings of the site assessment and the report should not be copied in part or altered in any way.

Logs, figures, drawings, etc. are customarily included in our reports and are developed by scientists, engineers or geologists based on their interpretation of field logs (assembled by field personnel) and laboratory evaluation of field samples. These logs etc. should not under any circumstances be redrawn for inclusion in other documents or separated from the report in any way.

Geoenvironmental concerns are not at issue

Your report is not likely to relate any findings, conclusions, or recommendations about the potential for hazardous materials existing at the site unless specifically required to do so by the client. Specialist equipment, techniques, and personnel are used to perform a geoenvironmental assessment.
Contamination can create major health, safety and environmental risks. If you have no information about the potential for your site to be contaminated or create an environmental hazard, you are advised to contact Coffey for information relating to geoenvironmental issues.

Rely on Coffey for additional assistance

Coffey is familiar with a variety of techniques and approaches that can be used to help reduce risks for all parties to a project, from design to construction. It is common that not all approaches will be necessarily dealt with in your site assessment report due to concepts proposed at that time. As the project progresses through design towards construction, speak with Coffey to develop alternative approaches to problems that may be of genuine benefit both in time and cost.

Responsibility

Reporting relies on interpretation of factual information based on judgement and opinion and has a level of uncertainty attached to it, which is far less exact than the design disciplines. This has often resulted in claims being lodged against consultants, which are unfounded. To help prevent this problem, a number of clauses have been developed for use in contracts, reports and other documents. Responsibility clauses do not transfer appropriate liabilities from Coffey to other parties but are included to identify where Coffey's responsibilities begin and end. Their use is intended to help all parties involved to recognise their individual responsibilities. Read all documents from Coffey closely and do not hesitate to ask any questions you may have.

* For further information on this aspect reference should be made to "Guidelines for the Provision of Geotechnical information in Construction Contracts" published by the Institution of Engineers Australia, National headquarters, Canberra, 1987.

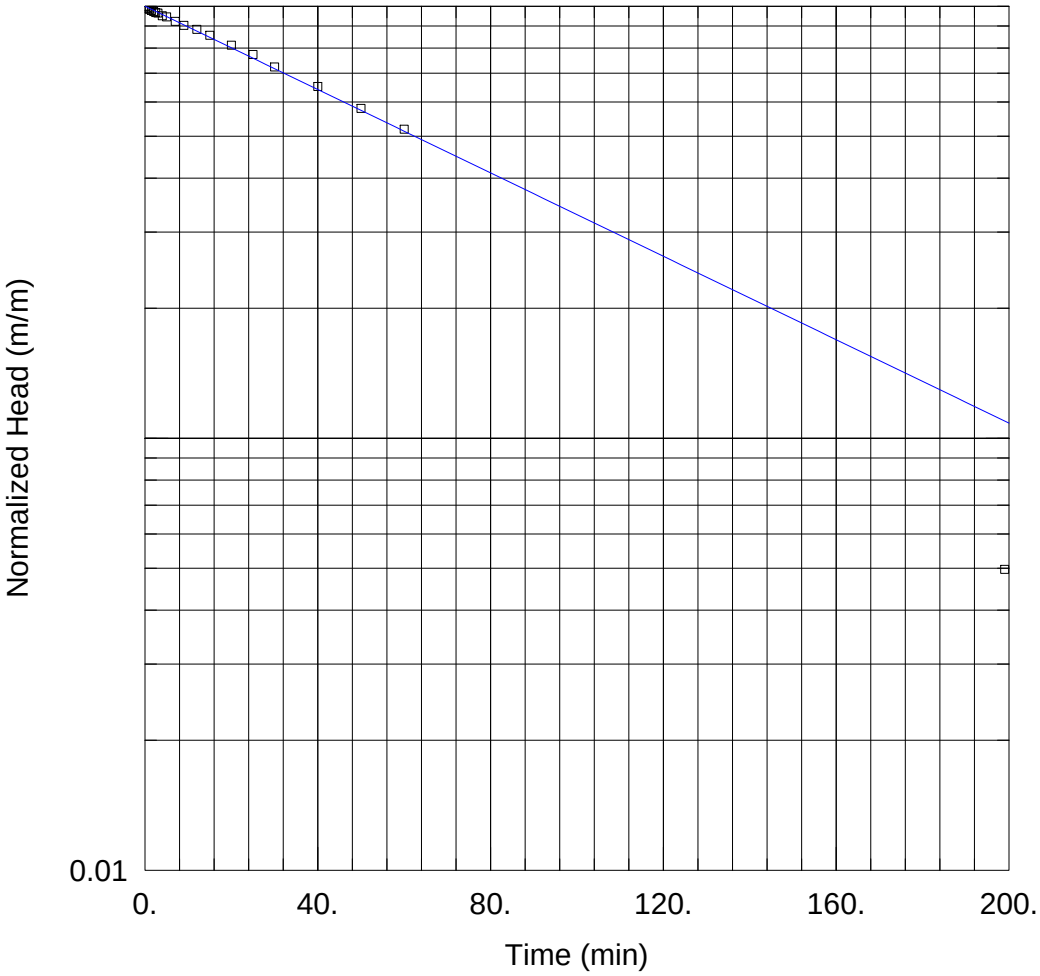
In-situ Hydraulic Conductivity Testing Results

In-Situ Hydraulic Conductivity Test 1 (BH H1-WC)

Prepared By:	Prepared For:
Coffey Geotechnics Inc.	HDR Corp.
Project:	**Location:**
GEOTETOB21649AA	Caledon, Region of Peel



SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 8.712E-6 cm/sec y0 = 1.811 m

AQUIFER DATA

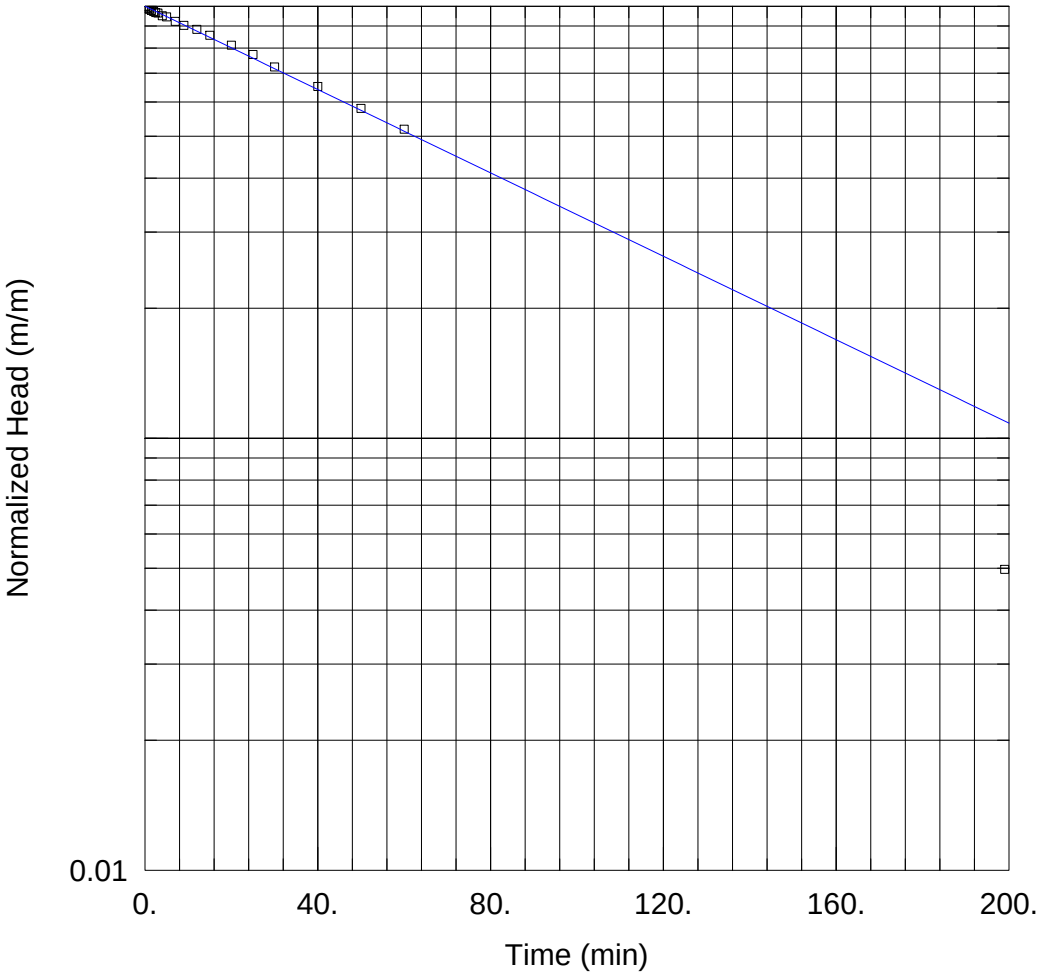
Saturated Thickness: 3.67 m Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (BH H1-WC)

Initial Displacement: 1.81 m
Static Water Column Height: 3.67 m
Total Well Penetration Depth: 2.62 m
Screen Length: 1.2 m
Casing Radius: 0.025 m
Well Radius: 0.1 m
Gravel Pack Porosity: 0.

In-Situ Hydraulic Conductivity Test 1 (BH H1-WC)

Prepared By:	Prepared For:
Coffey Geotechnics Inc.	HDR Corp.
Project:	**Location:**
GEOTETOB21649AA	Caledon, Region of Peel



SOLUTION

Aquifer Model: Confined
Solution Method: Bouwer-Rice

K = 1.023E-5 cm/sec y0 = 1.811 m

AQUIFER DATA

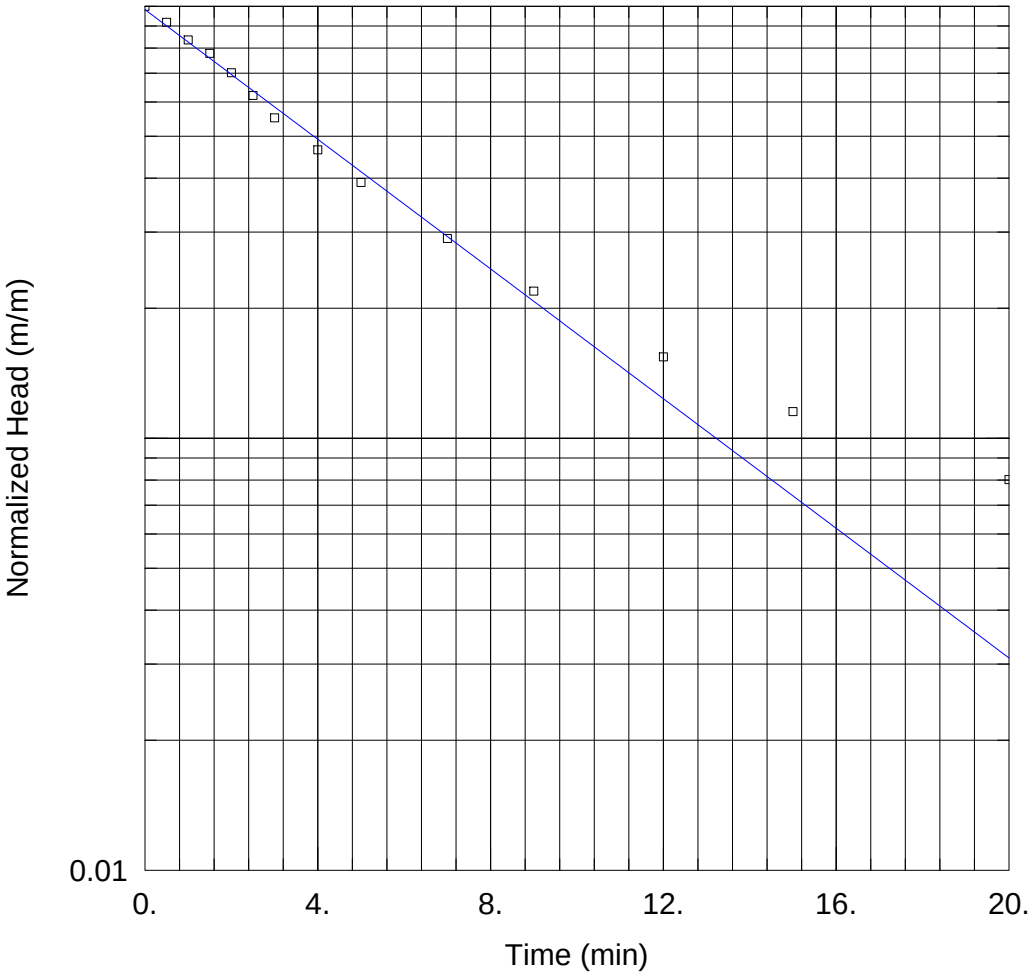
Saturated Thickness: 2.65 m Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (BH H1-WC)

Initial Displacement: 1.81 m
Static Water Column Height: 3.67 m
Total Well Penetration Depth: 2.62 m
Screen Length: 1.2 m
Casing Radius: 0.025 m
Well Radius: 0.1 m
Gravel Pack Porosity: 0.

In-Situ Hydraulic Conductivity Test 1 (BH 25-WC)

Prepared By:	Prepared For:
Coffey Geotechnics Inc.	HDR Corp.
Project:	**Location:**
GEOTETOB21649AA	Caledon, Region of Peel



SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 9.111E-5 cm/sec y0 = 4.772 m

AQUIFER DATA

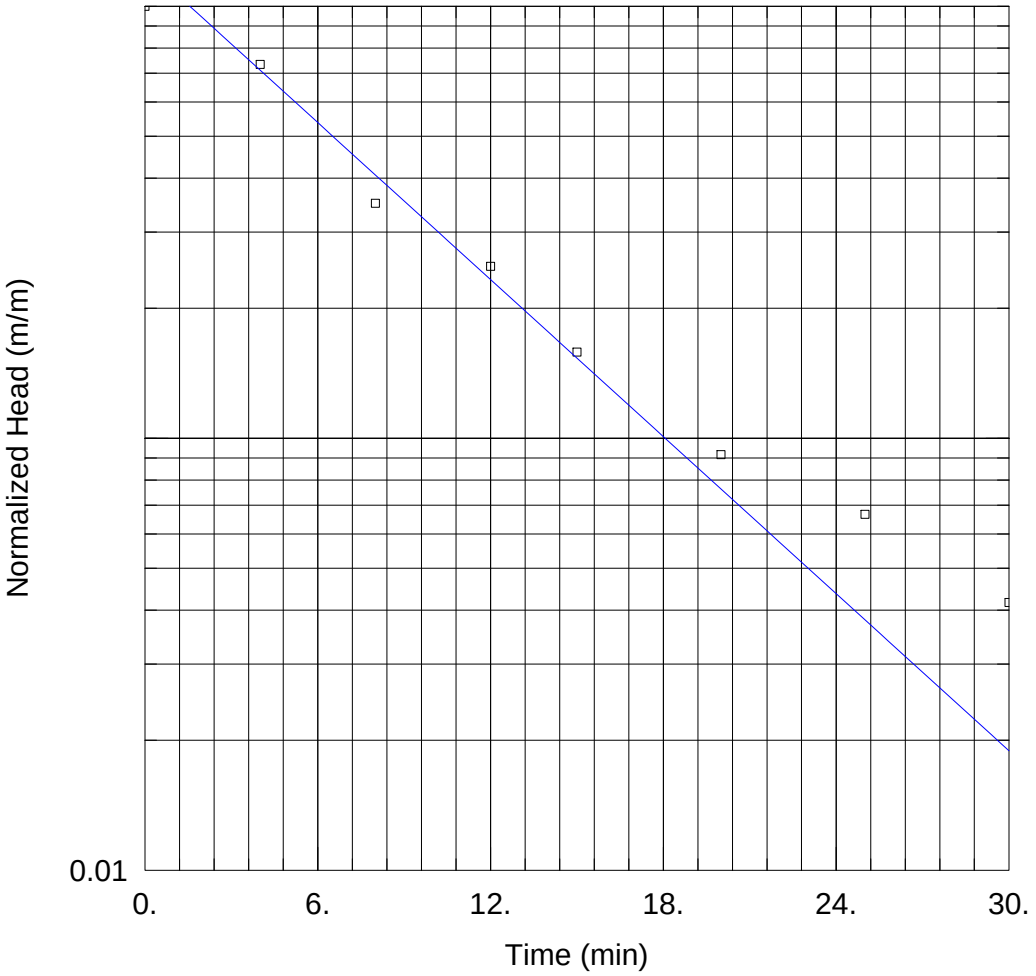
Saturated Thickness: 5.75 m Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (BH 25-WC)

Initial Displacement: 4.86 m
Static Water Column Height: 5.75 m
Total Well Penetration Depth: 5.64 m
Screen Length: 2.74 m
Casing Radius: 0.025 m
Well Radius: 0.1 m
Gravel Pack Porosity: 0.

In-Situ Hydraulic Conductivity Test 1 (BH H1-MR)

Prepared By:	Prepared For:
Coffey Geotechnics Inc.	HDR Corp.
Project:	**Location:**
GEOTETOB21649AA	Caledon, Region of Peel



SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 0.0001378 cm/sec y0 = 1.491 m

AQUIFER DATA

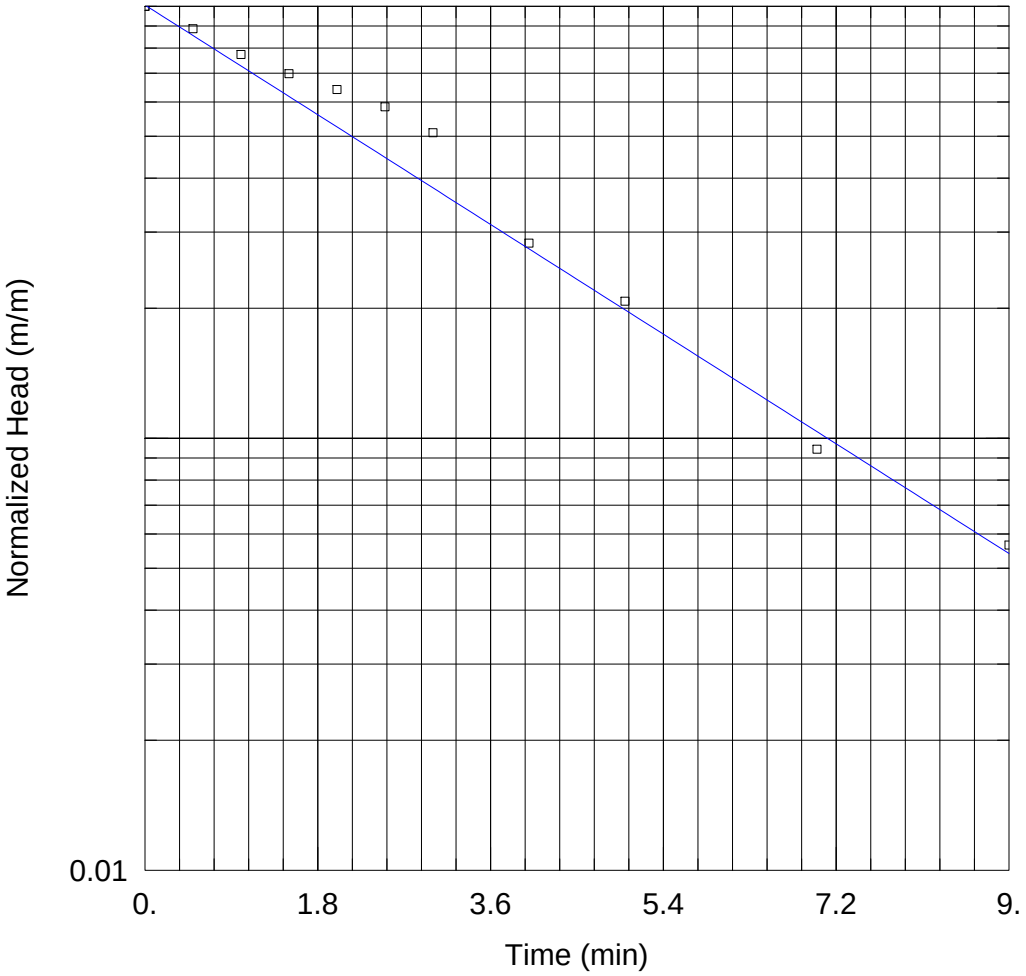
Saturated Thickness: 2.9 m Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (BH H1-MR)

Initial Displacement: 1.2 m
Static Water Column Height: 2.9 m
Total Well Penetration Depth: 3.17 m
Screen Length: 1.22 m
Casing Radius: 0.025 m
Well Radius: 0.1 m
Gravel Pack Porosity: 0.

In-Situ Hydraulic Conductivity Test 1 (BH H2-MR)

Prepared By:	Prepared For:
Coffey Geotechnics Inc.	HDR Corp.
Project:	**Location:**
GEOTETOB21649AA	Caledon, Region of Peel



SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 0.0002887 cm/sec y0 = 0.2667 m

AQUIFER DATA

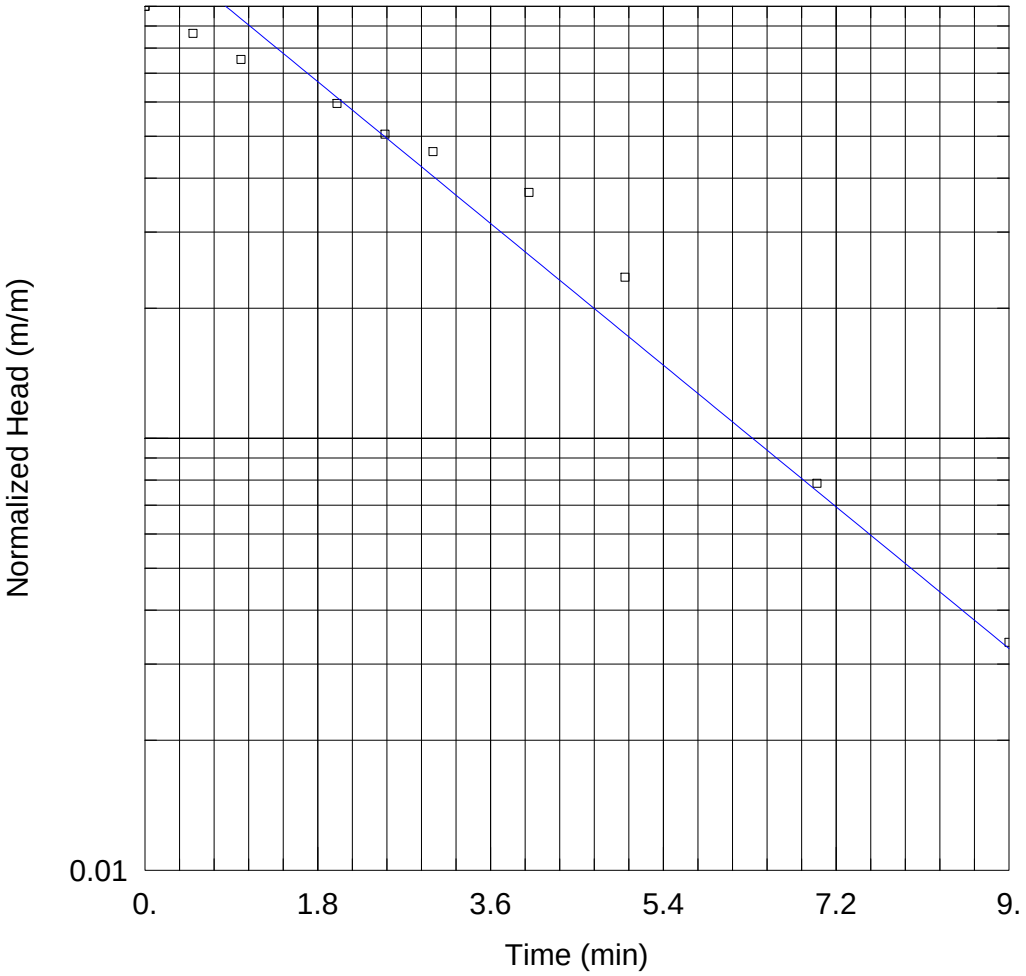
Saturated Thickness: 1.06 m Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (BH H2-MR)

Initial Displacement: 0.265 m
Static Water Column Height: 1.06 m
Total Well Penetration Depth: 0.61 m
Screen Length: 0.61 m
Casing Radius: 0.025 m
Well Radius: 0.1 m
Gravel Pack Porosity: 0.

In-Situ Hydraulic Conductivity Test 2 (BH H2-MR)

Prepared By:	Prepared For:
Coffey Geotechnics Inc.	HDR Corp.
Project:	**Location:**
GEOTETOB21649AA	Caledon, Region of Peel



SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 0.0003746 cm/sec y0 = 0.6333 m

AQUIFER DATA

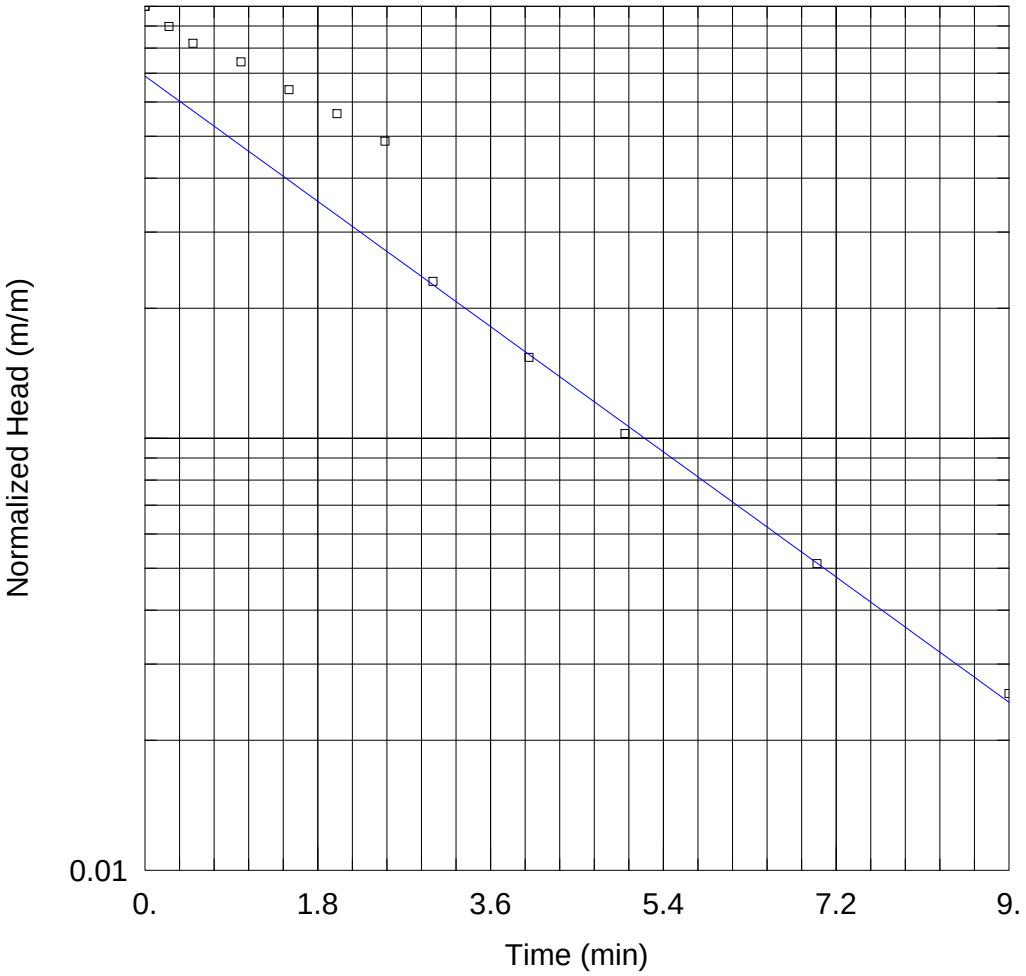
Saturated Thickness: 1.06 m Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (BH H2-MR)

Initial Displacement: 0.445 m
Static Water Column Height: 1.06 m
Total Well Penetration Depth: 0.6 m
Screen Length: 0.6 m
Casing Radius: 0.025 m
Well Radius: 0.1 m
Gravel Pack Porosity: 0.

In-Situ Hydraulic Conductivity Test 3 (BH H2-MR)

Prepared By:	Prepared For:
Coffey Geotechnics Inc.	HDR Corp.
Project:	**Location:**
GEOTETOB21649AA	Caledon, Region of Peel



SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 0.0003244 cm/sec y0 = 0.2687 m

AQUIFER DATA

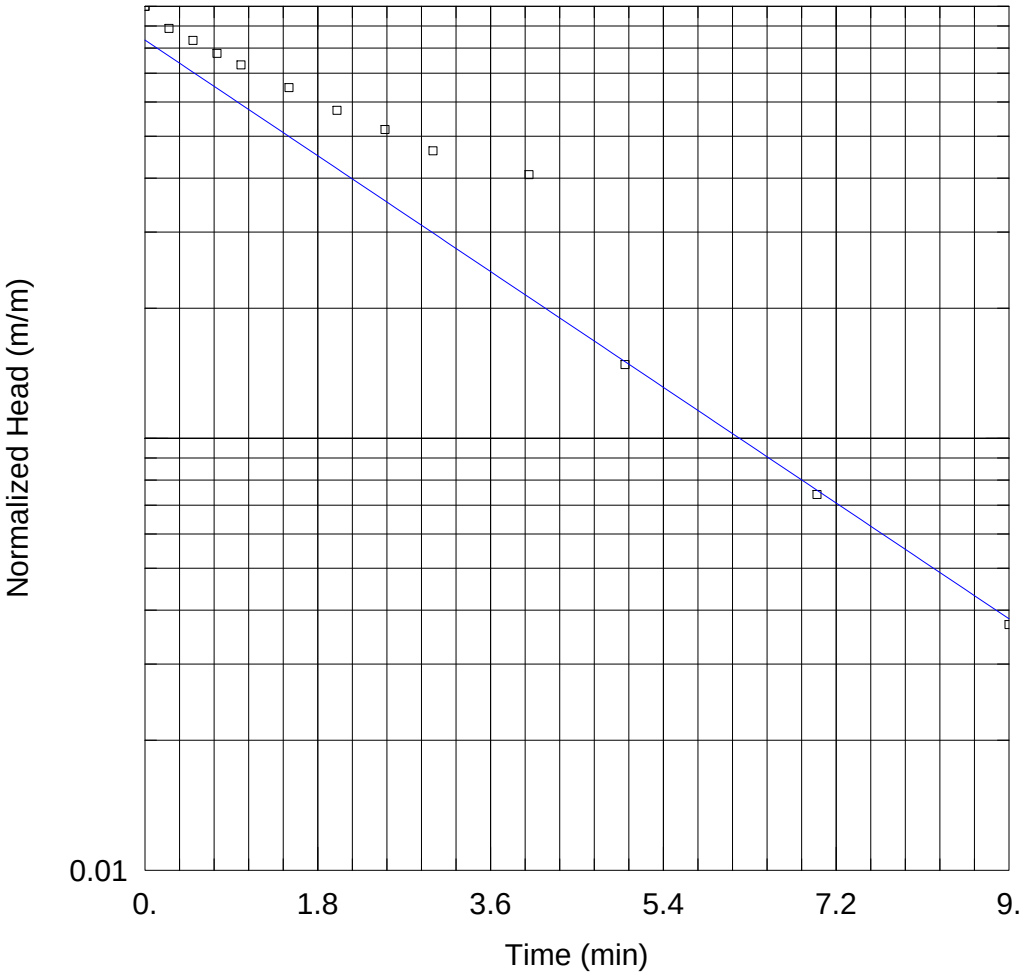
Saturated Thickness: 1.09 m Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (BH H2-MR)

Initial Displacement: 0.39 m
Static Water Column Height: 1.09 m
Total Well Penetration Depth: 0.64 m
Screen Length: 0.64 m
Casing Radius: 0.025 m
Well Radius: 0.1 m
Gravel Pack Porosity: 0.

In-Situ Hydraulic Conductivity Test 4 (BH H2-MR)

Prepared By:	Prepared For:
Coffey Geotechnics Inc.	HDR Corp.
Project:	**Location:**
GEOTETOB21649AA	Caledon, Region of Peel



SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 0.0002998 cm/sec y0 = 0.451 m

AQUIFER DATA

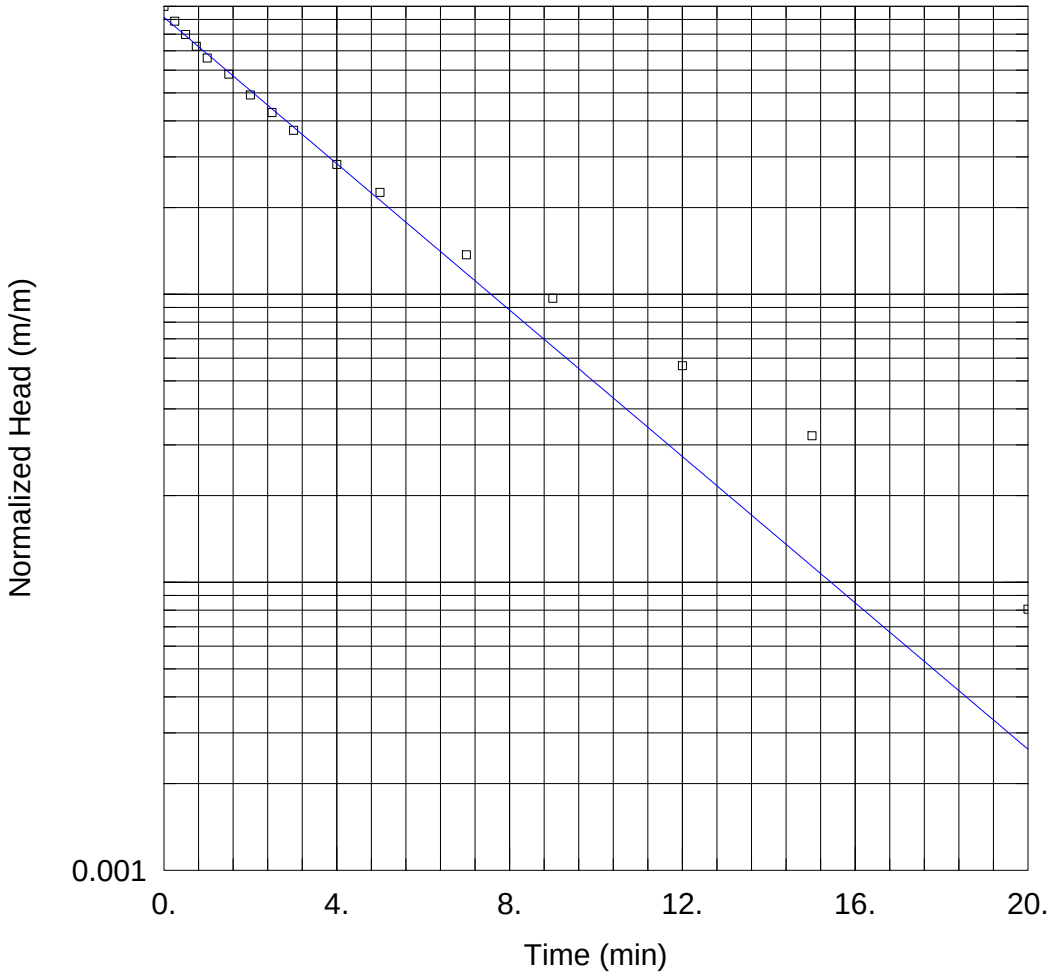
Saturated Thickness: 1.09 m Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (BH H2-MR)

Initial Displacement: 0.54 m
Static Water Column Height: 1.09 m
Total Well Penetration Depth: 0.64 m
Screen Length: 0.64 m
Casing Radius: 0.025 m
Well Radius: 0.1 m
Gravel Pack Porosity: 0.

In-Situ Hydraulic Conductivity Test 1 (BH H3-MR)

Prepared By:	Prepared For:
Coffey Geotechnics Inc.	HDR Corp.
Project:	**Location:**
GEOTETOB21649AA	Caledon, Region of Peel



SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 0.0003343 cm/sec y0 = 1.135 m

AQUIFER DATA

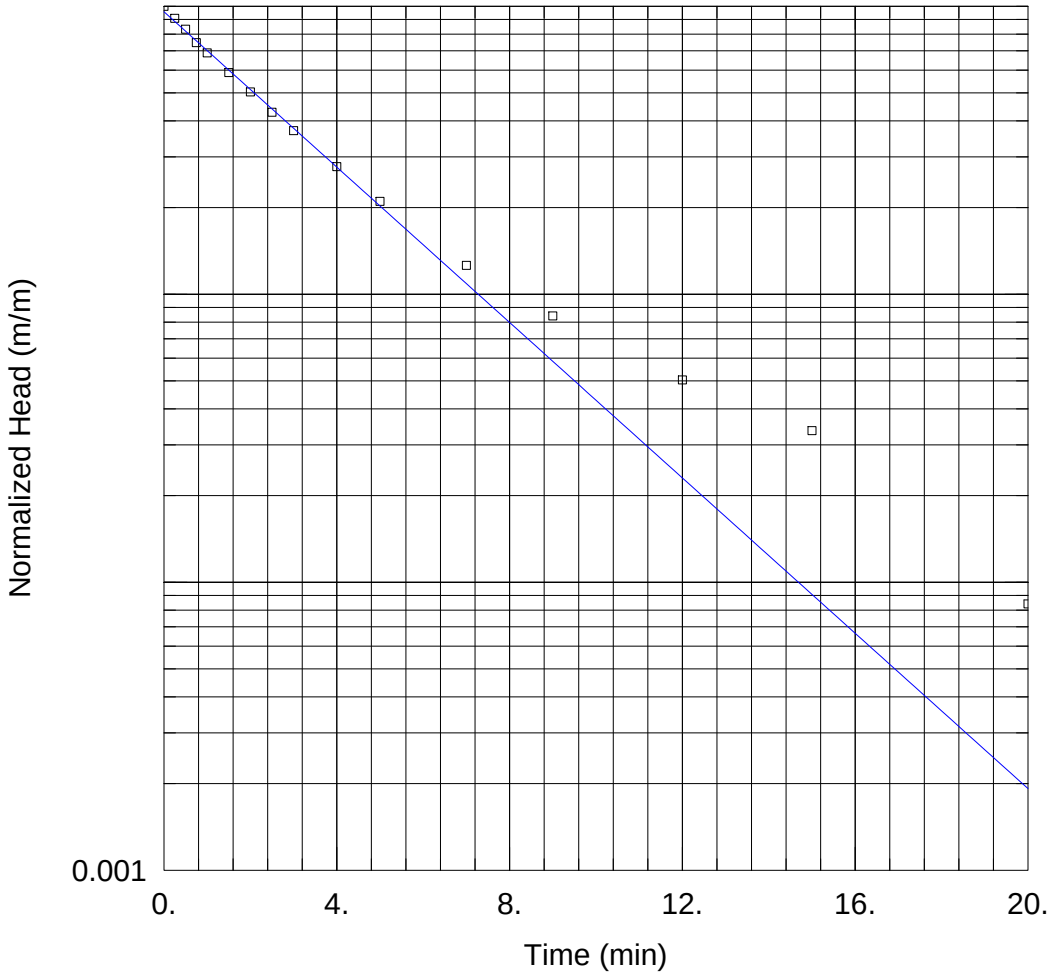
Saturated Thickness: 1.99 m Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (BH H3-MR)

Initial Displacement: 1.24 m
Static Water Column Height: 1.99 m
Total Well Penetration Depth: 1.54 m
Screen Length: 0.6 m
Casing Radius: 0.025 m
Well Radius: 0.1 m
Gravel Pack Porosity: 0.

In-Situ Hydraulic Conductivity Test 2 (BH H3-MR)

Prepared By:	Prepared For:
Coffey Geotechnics Inc.	HDR Corp.
Project:	**Location:**
GEOTETOB21649AA	Caledon, Region of Peel



SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 0.0003548 cm/sec y0 = 1.138 m

AQUIFER DATA

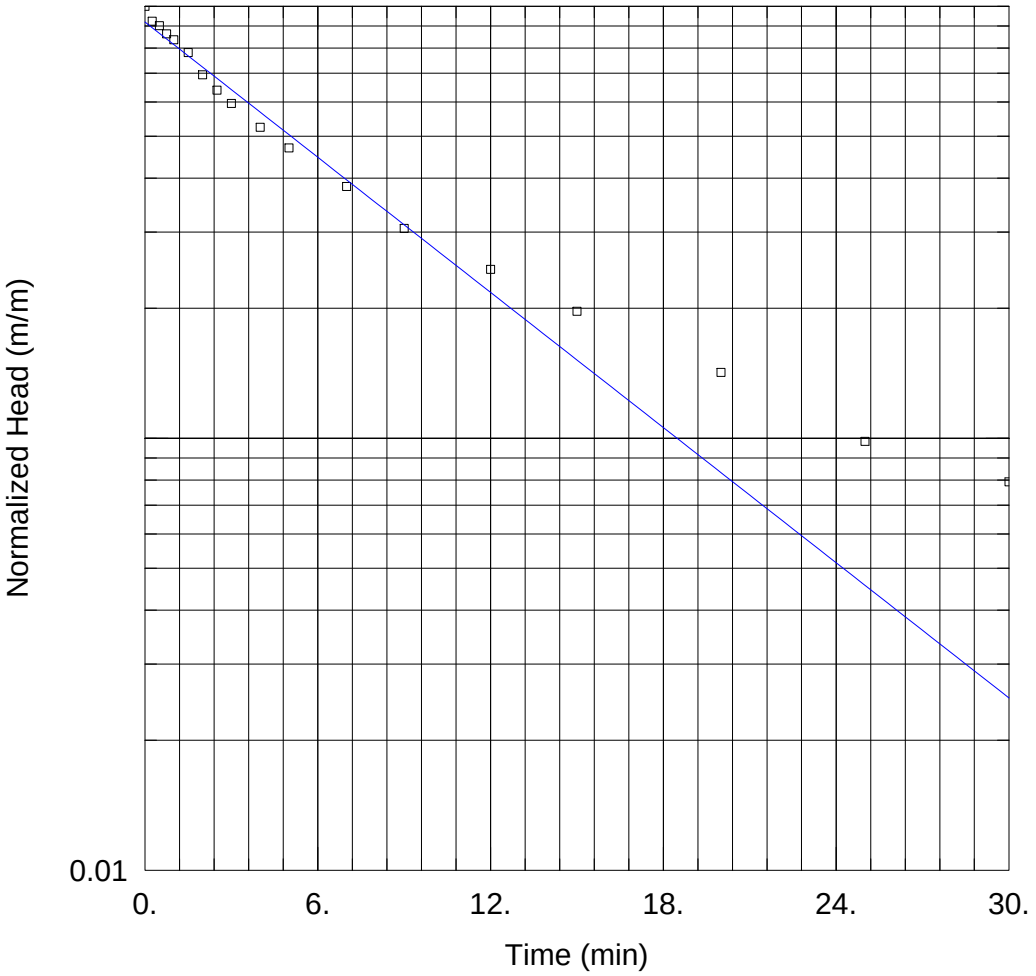
Saturated Thickness: 1.99 m Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (BH H3-MR)

Initial Displacement: 1.19 m
Static Water Column Height: 1.99 m
Total Well Penetration Depth: 1.54 m
Screen Length: 0.6 m
Casing Radius: 0.025 m
Well Radius: 0.1 m
Gravel Pack Porosity: 0.

In-Situ Hydraulic Conductivity Test 1 (BH H4-MR)

Prepared By:	Prepared For:
Coffey Geotechnics Inc.	HDR Corp.
Project:	**Location:**
GEOTETOB21649AA	Caledon, Region of Peel



SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 9.861E-5 cm/sec y0 = 1.682 m

AQUIFER DATA

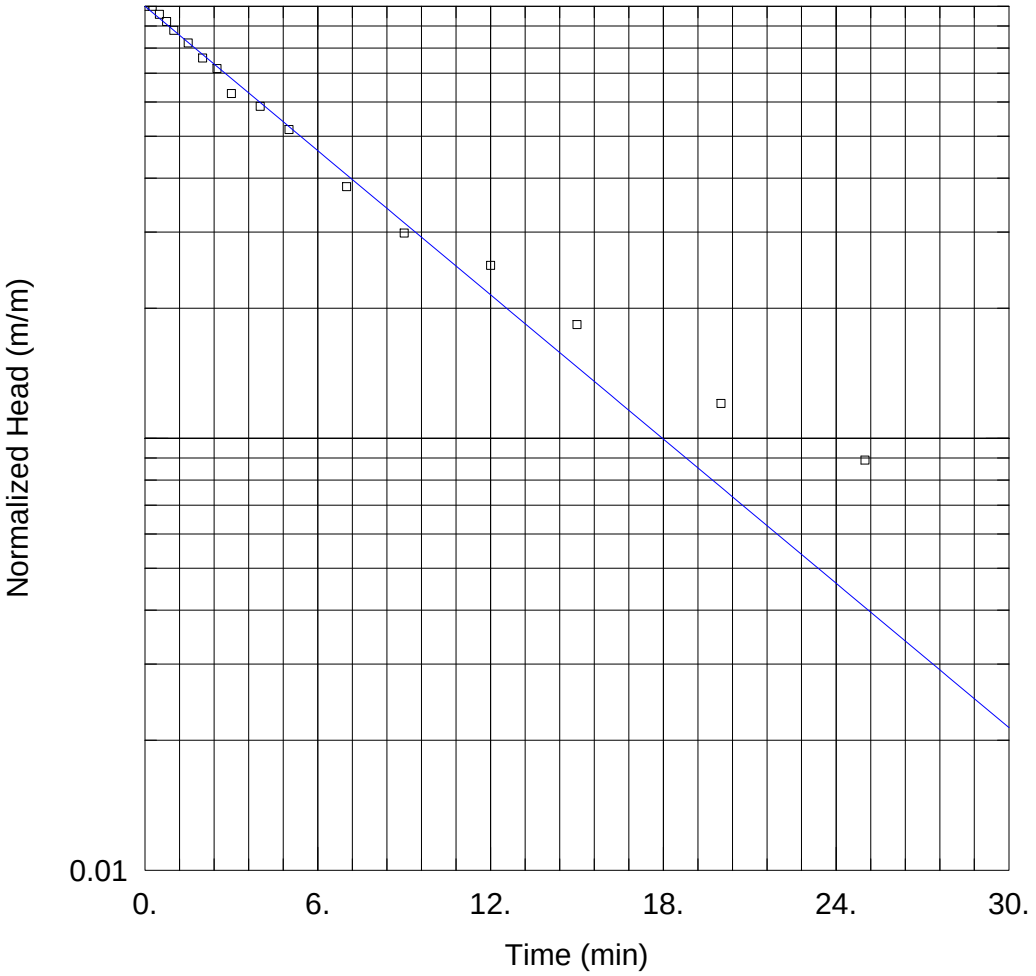
Saturated Thickness: 4.17 m Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (BH H4-MR)

Initial Displacement: 1.83 m
Static Water Column Height: 4.17 m
Total Well Penetration Depth: 3.38 m
Screen Length: 1.22 m
Casing Radius: 0.025 m
Well Radius: 0.1 m
Gravel Pack Porosity: 0.

In-Situ Hydraulic Conductivity Test 2 (BH H4-MR)

Prepared By:	Prepared For:
Coffey Geotechnics Inc.	HDR Corp.
Project:	**Location:**
GEOTETOB21649AA	Caledon, Region of Peel



SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 0.0001054 cm/sec y0 = 1.909 m

AQUIFER DATA

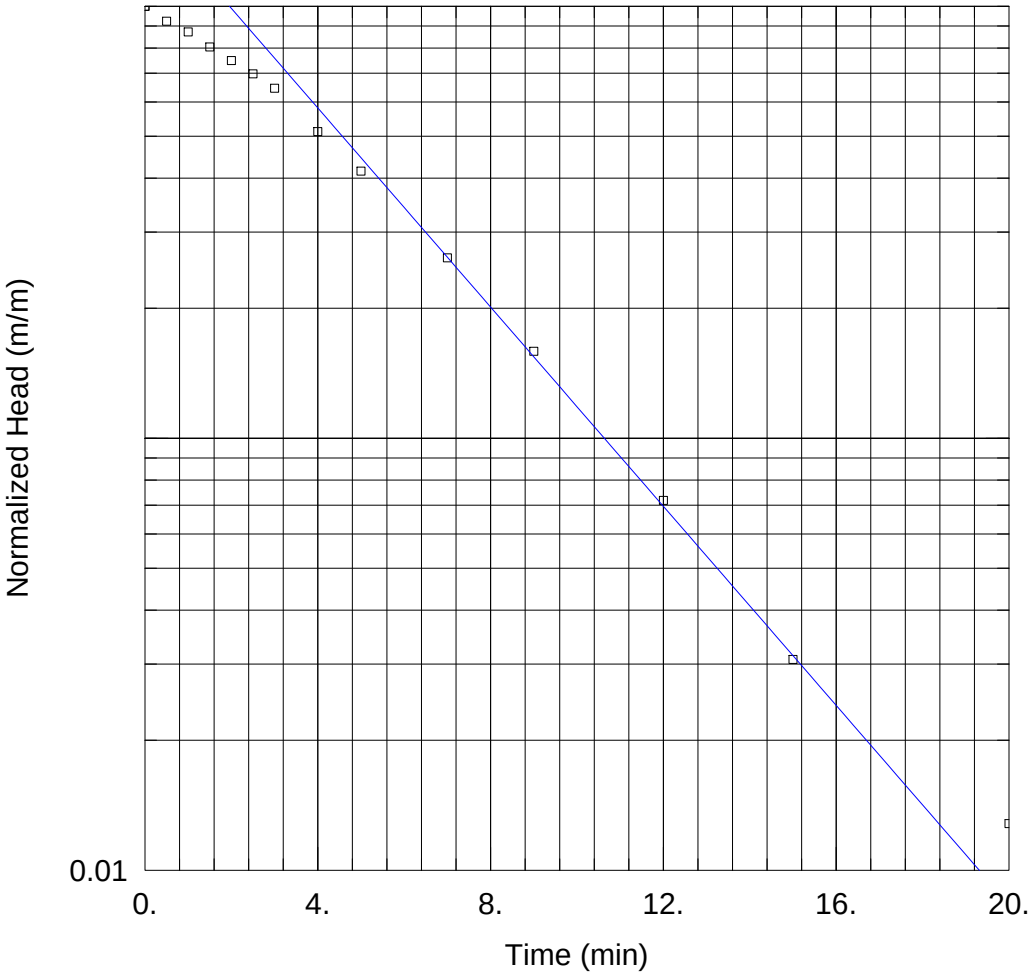
Saturated Thickness: 4.2 m Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (BH H4-MR)

Initial Displacement: 1.91 m
Static Water Column Height: 4.2 m
Total Well Penetration Depth: 3.41 m
Screen Length: 1.22 m
Casing Radius: 0.025 m
Well Radius: 0.1 m
Gravel Pack Porosity: 0.

In-Situ Hydraulic Conductivity Test 1 (BH H1-OBL)

Prepared By:	Prepared For:
Coffey Geotechnics Inc.	HDR Corp.
Project:	**Location:**
GEOTETOB21649AA	Caledon, Region of Peel



SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 0.0002701 cm/sec y0 = 3.276 m

AQUIFER DATA

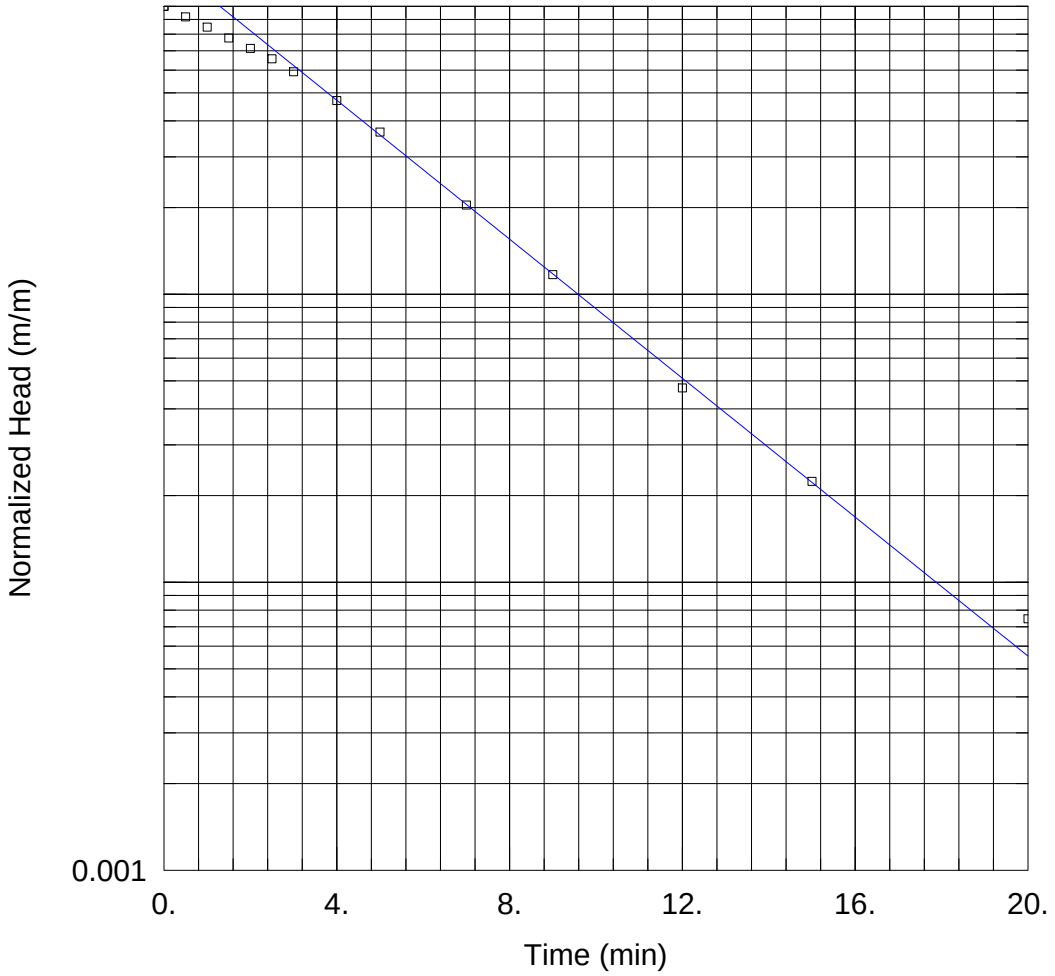
Saturated Thickness: 2.7 m Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (BH H1-OBL)

Initial Displacement: 1.95 m
Static Water Column Height: 2.7 m
Total Well Penetration Depth: 3.67 m
Screen Length: 1.22 m
Casing Radius: 0.025 m
Well Radius: 0.1 m
Gravel Pack Porosity: 0.

In-Situ Hydraulic Conductivity Test 2 (BH H1-OBL)

Prepared By:	Prepared For:
Coffey Geotechnics Inc.	HDR Corp.
Project:	**Location:**
GEOTETOB21649AA	Caledon, Region of Peel



SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 0.0002828 cm/sec y0 = 2.879 m

AQUIFER DATA

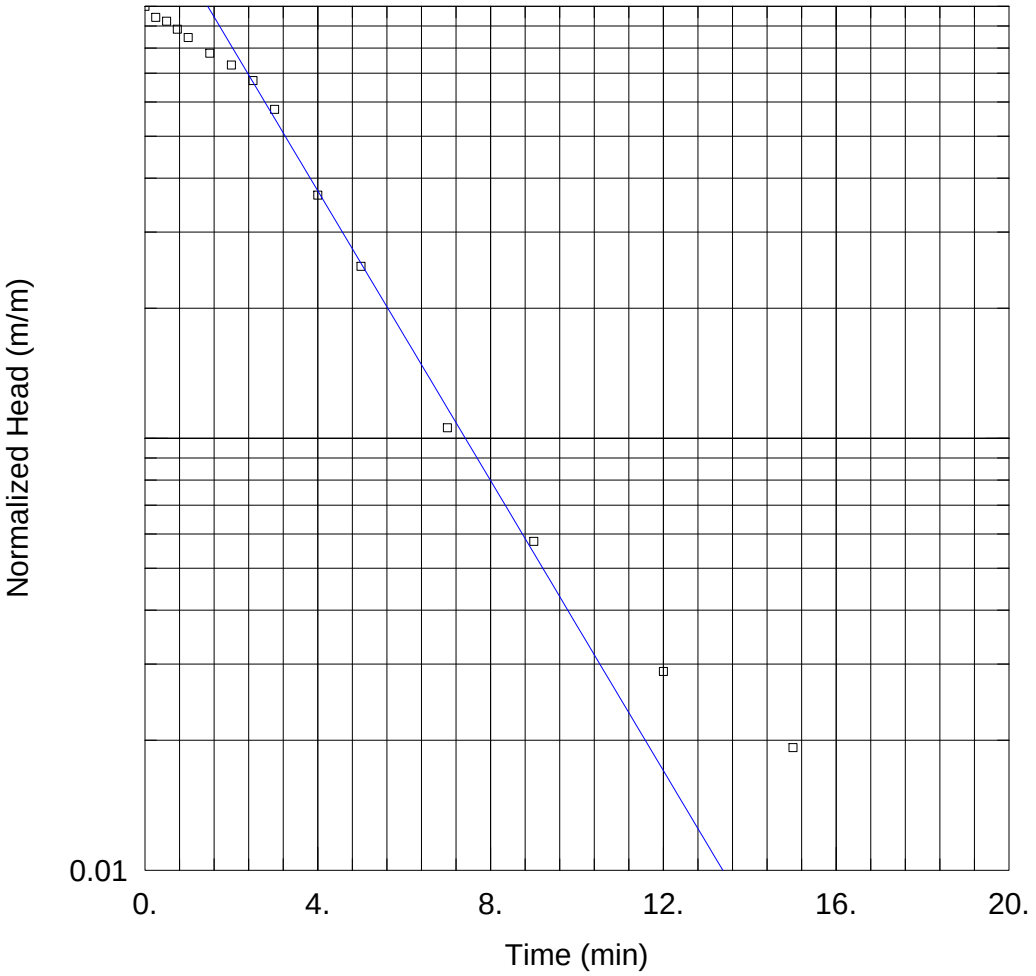
Saturated Thickness: 2.7 m Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (BH H1-OBL)

Initial Displacement: 2.01 m
Static Water Column Height: 2.7 m
Total Well Penetration Depth: 3.67 m
Screen Length: 1.22 m
Casing Radius: 0.025 m
Well Radius: 0.1 m
Gravel Pack Porosity: 0.

In-Situ Hydraulic Conductivity Test 1 (H3-OBL)

Prepared By:	Prepared For:
Coffey Geotechnics Inc.	HDR Corp.
Project:	**Location:**
GEOTETOB21649AA	Caledon, Region of Peel



SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 0.000281 cm/sec y0 = 1.822 m

AQUIFER DATA

Saturated Thickness: 2.38 m Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (BH 25-WC)

Initial Displacement: 1.04 m
Static Water Column Height: 2.38 m
Total Well Penetration Depth: 1.75 m
Screen Length: 1.22 m
Casing Radius: 0.025 m
Well Radius: 0.1 m
Gravel Pack Porosity: 0.

Appendix: Ontario Database Descriptions

EcoLog Environmental Risk Information Services Ltd can search the following databases. The extent of historical information varies with each database and current information is determined by what is publicly available to EcoLog ERIS at the time of update. **Note:** Databases denoted with "*" indicates that the database will no longer be updated. See the individual database descriptions for more information.

Provincial Government Source Databases:

Abandoned Aggregate Inventory **Up to Sept 2002** **AAGR**

The MAAP Program maintains a database of all abandoned pits and quarries. Please note that the database is only referenced by lot and concession and city/town location. The database provides information regarding the location, type, size, land use, status and general comments.

Aggregate Inventory **Up to Jun 2011** **AGR**

The Ontario Ministry of Natural Resources maintains a database of all active pits and quarries. Please note that the database is only referenced by lot\concession and city/town location. The database provides information regarding the registered owner/operator, location, status, licence type, and maximum tonnage.

Abandoned Mines Information System **1800-Jan 2012** **AMIS**

The Abandoned Mines Information System contains data on known abandoned and inactive mines located on both Crown and privately held lands. The information was provided by the Ministry of Northern Development and Mines (MNDM), with the following disclaimer: "the database provided has been compiled from various sources, and the Ministry of Northern Development and Mines makes no representation and takes no responsibility that such information is accurate, current or complete". Reported information includes official mine name, status, background information, mine start/end date, primary commodity, mine features, hazards and remediation.

Borehole **1875-Aug 2011** **BORE**

A borehole is the generalized term for any narrow shaft drilled in the ground, either vertically or horizontally. The information here includes geotechnical investigations or environmental site assessments, mineral exploration, or as a pilot hole for installing piers or underground utilities. Information is from many sources such as the Ministry of Transportation (MTO) boreholes from engineering reports and projects from the 1950 to 1990's in Southern Ontario. Boreholes from the Ontario Geological Survey (OGS) including The Urban Geology Analysis Information System (UGAIS) and the York Peel Durham Toronto (YPDT) database of the Conservation Authority Moraine Coalition. This database will include fields such as location, stratigraphy, depth, elevation, year drilled, etc.
For all water well data or oil and gas well data for Ontario please refer to WWIS and OOGW.

Certificates of Approval **1985-Oct 30, 2011*** **CA**

This database contains the following types of approvals: Air & Noise, Industrial Sewage, Municipal & Private Sewage, Waste Management Systems and Renewable Energy Approvals. The MOE in Ontario states that any facility that releases emissions to the atmosphere, discharges contaminants to ground or surface water, provides potable water supplies, or stores, transports or disposes of waste, must have a Certificate of Approval before it can operate lawfully. Fields include approval number, business name, address, approval date, approval type and status. This database will no longer be updated, as CofA's have been replaced by either Environmental Activity and Sector Registry (EASR) or Environmental Compliance Approval (ECA). Please refer to those individual databases for any information after Oct.31, 2011.

TSSA Commercial Fuel Oil Tanks 1948-Aug 2011 **CFOT**

Since May 2002, Ontario developed a new act where it became mandatory for fuel oil tanks to be registered with Technical Standards & Safety Authority (TSSA). This data would include all commercial underground fuel oil tanks in Ontario with fields such as location, registration number, tank material, age of tank and tank size.

Inventory of Coal Gasification Plants and Coal Tar Sites April 1987 and November 1988* **COAL**

This inventory includes both the "Inventory of Coal Gasification Plant Waste Sites in Ontario-April 1987" and the "Inventory of Industrial Sites Producing or Using Coal Tar and Related Tars in Ontario-November 1988) collected by the MOE. It identifies industrial sites that produced and continue to produce or use coal tar and other related tars. Detailed information is available and includes: facility type, size, land use, information on adjoining properties, soil condition, site operators/occupants, site description, potential environmental impacts and historic maps available. This was a one-time inventory.*

Compliance and Convictions 1989-Oct 2012 **CONV**

This database summarizes the fines and convictions handed down by the Ontario courts beginning in 1989. Companies and individuals named here have been found guilty of environmental offenses in Ontario courts of law.

Certificates of Property Use 1994-Oct 2012 **CPU**

This is a subset taken from Ontario's Environmental Registry (EBR) database. It will include all CPU's on the registry such as (EPA s. 168.6) - Certificate of Property Use.

Drill Holes 1886-Oct 2011 **DRL**

The Ontario Drill Hole Database contains information on more than 113,000 percussion, overburden, sonic and diamond drill holes from assessment files on record with the department of Mines and Minerals. Please note that limited data is available for southern Ontario, as it was the last area to be completed. The database was created when surveys submitted to the Ministry were converted in the Assessment File Research Image Database (AFRI) project. However, the degree of accuracy (coordinates) as to the exact location of drill holes is dependent upon the source document submitted to the MNDM. Levels of accuracy used to locate holes are: centering on the mining claim; a sketch of the mining claim; a 1:50,000 map; a detailed company map; or from submitted a "Report of Work".

Environmental Activity and Sector Registry Oct 31, 2011-Nov 2012 **EASR**

On October 31, 2011, a smarter, faster environmental approvals system came into effect in Ontario. The EASR allows businesses to register certain activities with the ministry, rather than apply for an approval. The registry is available for common systems and processes, to which preset rules of operation can be applied. The EASR is currently available for: heating systems, standby power systems and automotive refinishing. Businesses whose activities aren't subject to the EASR may apply for an ECA (Environmental Compliance Approval), Please see our ECA database.

Environmental Registry 1994-Oct 2012 **EBR**

The Environmental Registry lists proposals, decisions and exceptions regarding policies, Acts, instruments, or regulations that could significantly affect the environment. Through the Registry, thirteen provincial ministries notify the public of upcoming proposals and invite their comments. For example, if a local business is requesting a permit, license, or certificate of approval to release substances into the air or water; these are notified on the registry. Data includes: Approval for discharge into the natural environment other than water (i.e. Air) - EPA s. 9, Approval for sewage works - OWRA s. 53(1), and EPA s. 27 - Approval for a waste disposal site. For information regarding Permit to Take Water (PTTW), Certificate of Property Use (CPU) and (ORD) Orders please refer to those individual databases.

Environmental Compliance Approval **Oct 31, 2011-Nov 2012** **ECA**

On October 31, 2011, a smarter, faster environmental approvals system came into effect in Ontario. In the past, a business had to apply for multiple approvals (known as certificates of approval) for individual processes and pieces of equipment. Today, a business either registers itself, or applies for a single approval, depending on the types of activities it conducts. Businesses whose activities aren't subject to the EASR may apply for an ECA. A single ECA addresses all of a business's emissions, discharges and wastes. Separate approvals for air, noise and waste are no longer required. This database will also include Renewable Energy Approvals. For CofA's prior to Nov 1st, 2011, please refer to the CA database. For all Waste Disposal Sites please refer to the WDS database.

List of TSSA Expired Facilities **Current to Feb 2012** **EXP**

This is a list of all expired facilities that fall under the TSSA (TSS Act & Safety Regulations), including the six regulations that exist under the Fuels Safety Division. It will include facilities such as private fuel outlets, bulk plants, fuel oil tanks, gasoline stations, marinas, propane filling stations, liquid fuel tanks, piping systems, etc. These tanks have been removed and automatically fall under the expired facilities inventory held by TSSA.

TSSA Fuel Storage Tanks **Current to Jun 2011** **FST**

The Technical Standards & Safety Authority (TSSA), under the *Technical Standards & Safety Act* of 2000 maintains a database of registered private and retail fuel storage tanks in Ontario with fields such as location, tank status, license date, tank type, tank capacity, fuel type, installation year and facility type.

Ontario Regulation 347 Waste Generators Summary **1986-Apr 2012** **GEN**

Regulation 347 of the Ontario EPA defines a waste generation site as any site, equipment and/or operation involved in the production, collection, handling and/or storage of regulated wastes. A generator of regulated waste is required to register the waste generation site and each waste produced, collected, handled, or stored at the site. This database contains the registration number, company name and address of registered generators including the types of hazardous wastes generated. It includes data on waste generating facilities such as: drycleaners, waste treatment and disposal facilities, machine shops, electric power distribution etc. This information is a summary of all years from 1986 including the most currently available data. Some records may contain, within the company name, the phrase "See & Use…" followed by a series of letters and numbers. This occurs when one company is amalgamated with or taken over by another registered company. The number listed as "See & Use", refers to the new ownership and the other identification number refers to the original ownership. This phrase serves as a link between the 2 companies until operations have been fully transferred.

TSSA Historic Incidents **2006-June 2009** **HINC**

This database will cover all incidences recorded by TSSA with their older system, before they moved to their new management system. TSSA's Fuels Safety Program administers the *Technical Standards & Safety Act* 2000, providing fuel-related safety services associated with the safe transportation, storage, handling and use of fuels such as gasoline, diesel, propane, natural gas and hydrogen. Under this Act, TSSA regulates fuel suppliers, storage facilities, transport trucks, pipelines, contractors and equipment or appliances that use fuels. We also work to protect the public, the environment and property from fuel-related hazards such as spills, fires and explosions. This database will include spills and leaks from pipelines, diesel, fuel oil, gasoline, natural gas, propane and hydrogen recorded by the TSSA.

TSSA Incidents **June 2009-Mar 2012** **INC**

TSSA's Fuels Safety Program administers the *Technical Standards & Safety Act* 2000, providing fuel-related safety services associated with the safe transportation, storage, handling and use of fuels such as gasoline, diesel, propane, natural gas and hydrogen. Under this Act, TSSA regulates fuel suppliers, storage facilities, transport trucks, pipelines, contractors and equipment or appliances that use fuels. Includes incidents from fuel-related hazards such as spills, fires and explosions. This database will include spills and leaks from diesel, fuel oil, gasoline, natural gas, propane and hydrogen recorded by the TSSA.

Landfill Inventory Management Ontario 2010 **LIMO**

The Landfill Inventory Management Ontario (LIMO) database is updated every year, as the ministry compiles new and updated information. The inventory will include small and large landfills. Additionally, each year the ministry will request operators of the larger landfills complete a landfill data collection form that will be used to update LIMO and will include the following information from the previous operating year. This will include additional information such as estimated amount of total waste received, landfill capacity, estimated total remaining landfill capacity, fill rates, engineering designs, reporting and monitoring details, size of location, service area, approved waste types, leachate of site treatment, contaminant attenuation zone and more. The small landfills will include information such as site owner, site location and certificate of approval # and status.

Mineral Occurrences 1846-Nov 2011 **MNR**

In the early 70's, the Ministry of Northern Development and Mines created an inventory of approximately 19,000 mineral occurrences in Ontario, in regard to metallic and industrial minerals, as well as some information on building stones and aggregate deposits. Please note that the "Horizontal Positional Accuracy" is approximately +/- 200 m. Many reference elements for each record were derived from field sketches using pace or chain/tape measurements against claim posts or topographic features in the area. The primary limiting factor for the level of positional accuracy is the scale of the source material. The testing of horizontal accuracy of the source materials was accomplished by comparing the planimetric (X and Y) coordinates of that point with the coordinates of the same point as defined from a source of higher accuracy.

Non-Compliance Reports 1992(water only), 1994-2010 **NCPL**

The Ministry of the Environment provides information about non-compliant discharges of contaminants to air and water that exceed legal allowable limits, from regulated industrial and municipal facilities. A reported non-compliance failure may be in regard to a Control Order, Certificate of Approval, Sectoral Regulation or specific regulation/act.

Ontario Oil and Gas Wells 1800-Feb 2012 **OOGW**

In 1998, the MNR handed over to the Ontario Oil, Gas and Salt Resources Corporation, the responsibility of maintaining a database of oil and gas wells drilled in Ontario. The OGSR Library has over 20,000+ wells in their database. Information available for all wells in the ERIS database include well owner/operator, location, permit issue date, well cap date, licence no., status, depth and the primary target (rock unit) of the well being drilled. All geology/stratigraphy table information, plus all water table information is also provide for each well record.

Ontario Inventory of PCB Storage Sites 1987-Oct 2004 **OPCB**

The Ontario Ministry of Environment, Waste Management Branch, maintains an inventory of PCB storage sites within the province. Ontario Regulation 11/82 (Waste Management - PCB) and Regulation 347 (Generator Waste Management) under the Ontario EPA requires the registration of inactive PCB storage equipment and/or disposal sites of PCB waste with the Ontario Ministry of Environment. This database contains information on: 1) waste quantities; 2) major and minor sites storing liquid or solid waste; and 3) a waste storage inventory.

Orders 1994-Oct 2012 **ORD**

This is a subset taken from Ontario's Environmental Registry (EBR) database. It will include all Orders on the registry such as (EPA s. 17) - Order for remedial work, (EPA s. 18) - Order for preventative measures, (EPA s. 43) - Order for removal of waste and restoration of site, (EPA s. 44) - Order for conformity with Act for waste disposal sites, (EPA s. 136) - Order for performance of environmental measures.

Pesticide Register 1988-Mar 2011 **PES**

The Ontario Ministry of Environment maintains a database of all manufacturers and vendors of registered pesticides.

TSSA Pipeline Incidents **June 2009-Mar 2012** **PINC**

TSSA's Fuels Safety Program administers the *Technical Standards & Safety Act* 2000, providing fuel-related safety services associated with the safe transportation, storage, handling and use of fuels such as gasoline, diesel, propane, natural gas and hydrogen. Under this Act, TSSA regulates fuel suppliers, storage facilities, transport trucks, pipelines, contractors and equipment or appliances that use fuels. This database will include spills, strike and leaks from recorded by the TSSA.

Private and Retail Fuel Storage Tanks **1989-1996*** **PRT**

The Fuels Safety Branch of the Ontario Ministry of Consumer and Commercial Relations maintained a database of all registered private fuel storage tanks and licensed retail fuel outlets. This database includes an inventory of locations that have gasoline, oil, waste oil, natural gas and/or propane storage tanks on their property. The MCCR no longer collects this information. This information is now collected by the Technical Standards and Safety Authority (TSSA).

Permit to Take Water **1994-Oct 2012** **PTTW**

This is a subset taken from Ontario's Environmental Registry (EBR) database. It will include all PTTW's on the registry such as OWRA s. 34 - Permit to take water.

Ontario Regulation 347 Waste Receivers Summary **1986-2009** **REC**

Part V of the Ontario Environmental Protection Act ("EPA") regulates the disposal of regulated waste through an operating waste management system or a waste disposal site operated or used pursuant to the terms and conditions of a Certificate of Approval or a Provisional Certificate of Approval. Regulation 347 of the Ontario EPA defines a waste receiving site as any site or facility to which waste is transferred by a waste carrier. A receiver of regulated waste is required to register the waste receiving facility. This database represents registered receivers of regulated wastes, identified by registration number, company name and address, and includes receivers of waste such as: landfills, incinerators, transfer stations, PCB storage sites, sludge farms and water pollution control plants. This information is a summary of all years from 1986 including the most currently available data.

Record of Site Condition **1997-Sept 2001, Oct 2004-Oct 2012** **RSC**

The Record of Site Condition (RSC) is part of the Ministry of the Environment's Brownfields Environmental Site Registry. Protection from environmental cleanup orders for property owners is contingent upon documentation known as a record of site condition (RSC) being filed in the Environmental Site Registry. In order to file an RSC, the property must have been properly assessed and shown to meet the soil, sediment and groundwater standards appropriate for the use (such as residential) proposed to take place on the property. The Record of Site Condition Regulation (O. Reg. 153/04) details requirements related to site assessment and clean up.
RSCs filed after July 1, 2011 will also be included as part of the new (O.Reg. 511/09).

Ontario Spills **1988-2011** **SPL**

This database identifies information such as location (approximate), type and quantity of contaminant, date of spill, environmental impact, cause, nature of impact, etc. Information from 1988-2002 was part of the ORIS (Occurrence Reporting Information System). The SAC (Spills Action Centre) handles all spills reported in Ontario. Regulations for spills in Ontario are part of the MOE's Environmental Protection Act, Part X.

Wastewater Discharger Registration Database **1990-2011** **SRDS**

Information under this heading is combination of the following 2 programs. The Municipal/Industrial Strategy for Abatement (MISA) division of the Ontario Ministry of Environment maintained a database of all direct dischargers of toxic pollutants within nine sectors including: Electric Power Generation; Mining; Petroleum Refining; Organic Chemicals; Inorganic Chemicals; Pulp & Paper; Metal Casting; Iron & Steel; and Quarries. All sampling information is now collected and stored within the Sample Result Data Store (SRDS).

TSSA Variances for Abandonment of Underground Storage Tanks **Current to October 2011** **VAR**

The TSSA, Under the Liquid Fuels Handling Code and the Fuel Oil Code, all underground storage tanks must be removed within two years of disuse. If removal of a tank is not feasible, you may apply to seek a variance from this code requirement. This is a list of all variances granted for abandoned tanks.

Waste Disposal Sites - MOE CA Inventory **1970-Nov 2012** **WDS**

The Ontario Ministry of Environment, Waste Management Branch, maintains an inventory of known open (active or inactive) and closed disposal sites in the Province of Ontario. Active sites maintain a Certificate of Approval, are approved to receive and are receiving waste. Inactive sites maintain Certificate(s) of Approval but are not receiving waste. Closed sites are not receiving waste. The data contained within this database was compiled from the MOE's Certificate of Approval database. Locations of these sites may be cross-referenced to the Anderson database described under ERIS's Private Source Database section, by the CA number. All new Environmental Compliance Approvals handed out after Oct 31, 2011 for Waste Disposal Sites will still be found in this database.

Waste Disposal Sites - MOE 1991 Historical Approval Inventory **Up to Oct 1990*** **WDSH**

In June 1991, the Ontario Ministry of Environment, Waste Management Branch, published the "June 1991 Waste Disposal Site Inventory", of all known active and closed waste disposal sites as of October 30st, 1990. For each "active" site as of October 31st 1990, information is provided on site location, site/CA number, waste type, site status and site classification. For each "closed" site as of October 31st 1990, information is provided on site location, site/CA number, closure date and site classification. Locations of these sites may be cross-referenced to the Anderson database described under ERIS's Private Source Database section, by the CA number.

Water Well Information System **1955-2011** **WWIS**

This database describes locations and characteristics of water wells found within Ontario in accordance with Regulation 903. It includes such information as coordinates, construction date, well depth, primary and secondary use, pump rate, static water level, well status, etc. Also included are detailed stratigraphy information, approximate depth to bedrock and the approximate depth to the water table.

Federal Government Source Databases: Diagram Identifier:

Environmental Effects Monitoring **1992-2007*** **EEM**

The Environmental Effects Monitoring program assesses the effects of effluent from industrial or other sources on fish, fish habitat and human usage of fisheries resources. Since 1992, pulp and paper mills have been required to conduct EEM studies under the Pulp and Paper Effluent Regulations. This database provides information on the mill name, geographical location and sub-lethal toxicity data.

Environmental Issues Inventory System **1992-2001*** **EIIS**

The Environmental Issues Inventory System was developed through the implementation of the Environmental Issues and Remediation Plan. This plan was established to determine the location and severity of contaminated sites on inhabited First Nation reserves, and where necessary, to remediate those that posed a risk to health and safety; and to prevent future environmental problems. The EIIS provides information on the reserve under investigation, inventory number, name of site, environmental issue, site action (Remediation, Site Assessment), and date investigation completed.

Federal Convictions **1988-Jun 2007** **FCON**

Environment Canada maintains a database referred to as the "Environmental Registry" that details prosecutions under the Canadian Environmental Protection Act (CEPA) and the Fisheries Act (FA). Information is provided on the company name, location, charge date, offence and penalty.

Contaminated Sites on Federal Land **June 2000-Sept 2012** **FCS**

The Treasury Board of Canada Secretariat maintains an inventory of all known contaminated sites held by various Federal departments and agencies. This inventory does not include properties owned by Crown corporations, but does contain non-federal sites for which the Government of Canada has accepted some or all financial responsibility. All sites have been classified through a system developed by the Canadian Council of Ministers of the Environment. The database provides information on company name, location, site ID #, property use, classification, current status, contaminant type and plan of action for site remediation.

Fisheries & Oceans Fuel Tanks **1964-Sept 2003** **FOFT**

Fisheries & Oceans Canada maintains an inventory of all aboveground & underground fuel storage tanks located on Fisheries & Oceans property or controlled by DFO. Our inventory provides information on the site name, location, tank owner, tank operator, facility type, storage tank location, tank contents & capacity, and date of tank installation.

Indian & Northern Affairs Fuel Tanks **1950-Aug 2003** **IAFT**

The Department of Indian & Northern Affairs Canada (INAC) maintains an inventory of all aboveground & underground fuel storage tanks located on both federal and crown land. Our inventory provides information on the reserve name, location, facility type, site/facility name, tank type, material & ID number, tank contents & capacity, and date of tank installation.

National Analysis of Trends in Emergencies System (NATES) **1974-1994*** **NATE**

In 1974 Environment Canada established the National Analysis of Trends in Emergencies System (NATES) database, for the voluntary reporting of significant spill incidents. The data was to be used to assist in directing the work of the emergencies program. NATES ran from 1974 to 1994. Extensive information is available within this database including company names, place where the spill occurred, date of spill, cause, reason and source of spill, damage incurred, and amount, concentration, and volume of materials released.

National Defence & Canadian Forces Fuel Tanks **Up to May 2001*** **NDFT**

The Department of National Defence and the Canadian Forces maintains an inventory of all aboveground & underground fuel storage tanks located on DND lands. Our inventory provides information on the base name, location, tank type & capacity, tank contents, tank class, date of tank installation, date tank last used, and status of tank as of May 2001. This database will no longer be updated due to the new National Security protocols which have prohibited any release of this database.

National Defence & Canadian Forces Spills **Mar 1999-Aug 2010** **NDSP**

The Department of National Defence and the Canadian Forces maintains an inventory of spills to land and water. All spill sites have been classified under the "Transportation of Dangerous Goods Act - 1992". Our inventory provides information on the facility name, location, spill ID #, spill date, type of spill, as well as the quantity of substance spilled & recovered.

National Defence & Canadian Forces Waste Disposal Sites **2001-April 2007** **NDWD**

The Department of National Defence and the Canadian Forces maintains an inventory of waste disposal sites located on DND lands. Where available, our inventory provides information on the base name, location, type of waste received, area of site, depth of site, year site opened/closed and status.

National Environmental Emergencies System (NEES) 1974-2003 **NEES**

In 2000, the Emergencies program implemented NEES, a reporting system for spills of hazardous substances. For the most part, this system only captured data from the Atlantic Provinces, some from Quebec and Ontario and a portion from British Columbia. Data for Alberta, Saskatchewan, Manitoba and the Territories was not captured. However, NEES is also a repository for all previous Environment Canada spill datasets. NEES is composed of the historic datasets – or Trends – which dates from approximately 1974 to present. **NEES Trends** is a compilation of historic databases, which were merged and includes data from NATES (National Analysis of Trends in Emergencies System), ARTS (Atlantic Regional Trends System), and NEES. In 2001, the Emergencies Program determined that variations in reporting regimes and requirements between federal and provincial agencies made national spill reporting and trend analysis difficult to achieve. As a consequence, the department has focused efforts on capturing data on spills of substances which fall under its legislative authority only (CEPA and FA). As such, the NEES database will be decommissioned in December 2004.

National PCB Inventory 1988-2008 **NPCB**

Environment Canada's National PCB inventory includes information on in-use PCB containing equipment in Canada including federal, provincial and private facilities. All federal out-of-service PCB containing equipment and all PCB waste owned by the federal government or by federally regulated industries such as airlines, railway companies, broadcasting companies, telephone and telecommunications companies, pipeline companies, etc. are also listed. Although it is not Environment Canada's mandate to collect data on non-federal PCB waste, the National PCB inventory includes some information on provincial and private PCB waste and storage sites.

National Pollutant Release Inventory 1993-2010 **NPRI**

Environment Canada has defined the National Pollutant Release Inventory ("NPRI") as a federal government initiative designed to collect comprehensive national data regarding releases to air, water, or land, and waste transfers for recycling for more than 300 listed substances.

Parks Canada Fuel Storage Tanks 1920-Jan 2005 **PCFT**

Canadian Heritage maintains an inventory of all known fuel storage tanks operated by Parks Canada, in both National Parks and at National Historic Sites. The database details information on site name, location, tank install/removal date, capacity, fuel type, facility type, tank design and owner/operator.

Transport Canada Fuel Storage Tanks 1970-March 2007 **TCFT**

With the provinces of BC, MB, NB, NF, ON, PE, and QC; Transport Canada currently owns and operates 90 fuel storage tanks. This inventory will also include The Pickering Lands, which refers to the 7,530 hectares (18,600 acres) of land in Pickering, Markham and Uxbridge - owned by the Government of Canada since 1972. Properties on this land has been leased by the government since 1975, falls under the Site Management Policy of Transport Canada, but administered by Public Works and Government Services Canada. Our inventory provides information on the site name, location, tank age, capacity and fuel type.

Private Source Databases:

Anderson's Waste Disposal Sites 1860s-Present **ANDR**

The information provided in this database was collected by examining various historical documents which aimed to characterize the likely position of former waste disposal sites from 1860 to present. The research initiative behind the creation of this database was to identify those sites that are missing from the *Ontario MOE Waste Disposal Site Inventory*, as well as to provide revisions and corrections to the positions and descriptions of sites currently listed in the MOE inventory. In addition to historic waste disposal facilities, the database also identifies certain auto wreckers and scrap yards that have been extrapolated from documentary sources. *Please note that the data is not warranted to be complete, exhaustive or authoritive. The information was collected for research purposes only.*

Automobile Wrecking & Supplies 2001-Jun 2010 **AUWR**

This database provides an inventory of all known locations that are involved in the scrap metal, automobile wrecking/recycling, and automobile parts & supplies industry. Information is provided on the company name, location and business type.

Chemical Register 1992, 1999-Jun 2010 **CHEM**

This database includes information from both a one time study conducted in 1992 and private source and is a listing of facilities that manufacture or distribute chemicals. The production of these chemical substances may involve one or more chemical reactions and/or chemical separation processes (i.e. fractionation, solvent extraction, crystallization, etc.).

ERIS Historical Searches 1999-Apr 2012 **EHS**

EcoLog ERIS has compiled a database of all environmental risk reports completed since March 1999. Available fields for this database include: site location, date of report, type of report, and search radius. As per all other databases, the ERIS database can be referenced on both the map and "Statistical Profile" page.

Canadian Mine Locations 1998-2009 **MINE**

This information is collected from the Canadian & American Mines Handbook. The Mines database is a national database that provides over 290 listings on mines (listed as public companies) dealing primarily with precious metals and hard rocks. Listed are mines that are currently in operation, closed, suspended, or are still being developed (advanced projects). Their locations are provided as geographic coordinates (x, y and/or longitude, latitude). As of 2002, data pertaining to Canadian smelters and refineries has been appended to this database.

Oil and Gas Wells Oct 2001-Sept 2012 **OGW**

The Nickle's Energy Group (publisher of the Daily Oil Bulletin) collects information on drilling activity including operator and well statistics. The well information database includes name, location, class, status and depth. The main Nickles' database is updated on a daily basis, however, this database is updated on a monthly basis. More information is available at www.nickles.com.

Canadian Pulp and Paper 1999, 2002, 2004, 2005, 2009 **PAP**

This information is part of the Pulp and Paper Canada Directory. The Directory provides a comprehensive listing of the locations of pulp and paper mills and the products that they produce.

Retail Fuel Storage Tanks 2000-Jun 2010 **RST**

This database includes an inventory of retail fuel outlet locations (including marinas) that have on their property gasoline, oil, waste oil, natural gas and / or propane storage tanks. Information is provided on company name, location and type of business.

Scott's Manufacturing Directory 1992-Mar 2011 **SCT**

Scott's Directories is a data bank containing information on over 70,000 manufacturers in Ontario. Even though Scott's listings are voluntary, it is the most comprehensive database of Ontario manufacturers available. Information concerning a company's address, plant size, and main products are included in this database. This database begins with 1992 information and is updated annually.

Anderson's Storage Tanks 1915-1953* **TANK**

The information provided in this database was collected by examining various historical documents, which identified the location of former storage tanks, containing substances such as fuel, water, gas, oil, and other various types of miscellaneous products. Information is available in regard to business operating at tank site, tank location, permit year, permit & installation type, no. of tanks installed & configuration and tank capacity. *Data contained within this database pertains only to the city of Toronto and is not warranted to be complete, exhaustive or authoritative. The information was collected for research purposes only.*
